INTRODUCTION

Species Plantarum aims to provide in concise format, and with standardised data fields, basic taxonomic information on the vascular plants of the world, including accepted names and synonyms with bibliographic data, types of names, keys and descriptions from family to varietal levels, geographical distributions, ecological information and other related matters, and to publish it in both hard copy and electronic form.

The format of the *Species Plantarum* is based on that of *Flora of Australia*, with some departures made necessary by the different scale of the project. Initially at least, the series is being edited and published for the Species Plantarum Project and IOPI by the Australian Biological Resources Study (ABRS), producers of *Flora of Australia*.

Treatments are contributed on a voluntary basis. Each part of *Species Plantarum* is intended to provide a complete account of a family, subfamily, large genus or other related taxonomic group. While treatments of small families may be shorter, it is intended that contributions will, in general, cover at least 50 to 100 species. The taxonomy adopted is that of the author, although the family delimitations recommended are initially those of R.K.Brummitt, *Vascular Plant Families and Genera* (1992). The order of taxa within families, genera and species in the *Species Plantarum* is intended to reflect natural relationships, so far as this is possible in a linear sequence.

Maps are provided for each species, or in those cases where infraspecific taxa are recognised, for each of the terminal taxa. Distribution maps are based on those in R.K.Brummitt, *World Geographical Scheme for Recording Plant Distributions* ed. 2 (2001), and the 'countries' adopted are those of Level 3 and 4 of that work. Description of distribution follows the same work, with a two-digit code for regions and a three-letter code for the 'country'. Upper case letters for the 'country' indicate native distribution; lower case letters indicate that the taxon is only present in that 'country' as an introduced and naturalised plant. If a taxon is extinct in a 'country', this is indicated by a dagger. Distribution of species as cultivated plants is not included.

Misapplied and invalid names are, in general, omitted. Journal titles are abbreviated according to G.D.R.Bridson & E.R.Smith, *Botanico-Periodicum-Huntianum / Supplementum* (1991). Book titles are abbreviated according to F.A.Stafleu & R.S.Cowan, *Taxonomic Literature* (2nd edn) Vols 1–7, and *Supplements* (1976–), except that upper case initial letters are used for proper names and significant words. Authors of plant names are abbreviated according to R.K.Brummitt & C.E.Powell, *Authors of Plant Names* (1992).

A separate part, *Introduction to the Series*, provides a history of the project, a glossary, guide for contributors and key to the conventions used in describing distribution. These resources will also be available on the World Wide Web, initially through the ABRS site (currently <http://www.anbg.gov.au/abrs/flora/spplant/spplant.htm>) with links from the IOPI site (currently <http://life.csu.edu.au/iopi/iopihome>) and others.

PREFACE

This volume is the first of a three-part treatment of the Juncaceae. Parts 2 and 3 are written as this goes to press and are scheduled for publication very shortly.

The co-operative monographic study was completed in the period 1997 to 2000, under grant no. 206/97/0936 of the Czech National Grant Agency. Almost all the current experts in the taxonomy of the family kindly participated in the project, and their expertise covered both the centres of taxonomic diversity and the most intricate groups in the family. The monograph thus presents the cumulative knowledge of the Juncaceae at this time. Some groups received special attention and their accounts represent new revisions (e.g., *Luzula* sect. *Atlanticae*, sect. *Alpiniae*, subg. *Pterodes*) or recent revisions were incorporated (e.g., *Juncus* sect. *Caespitosi*, in part, and *Juncus* sect. *Juncus*). The project benefited from an important coincidence: the Juncaceae have been included in recent volumes of important regional or continental floras, either published in 1999 or 2000, or prepared for publication; the authors of several regional accounts participated in our project (including those from *Flora of North America*, *Flora of China*, *Flora of Australia* and *Flora Neotropica*). Despite this, some groups or sections still require a thorough revision in future, and a number of questions remain unanswered, particularly in *Luzula* sect. *Luzula* in China and Japan, *Juncus* sect. *Stygiopsis* and *Juncus* sect. *Juncotypus*.

While the text represents the combined work of many authors, the final version was prepared by JK, and he accepts responsibility for any errors or missing data.

In addition to the authors and advisers, many other botanists participated in solving numerous problems with old literature, nomenclatural problems and geographical distribution. I would like to express my thanks for their generous help. Invaluable technical assistance was provided by Ms Věra Matějovičová. Dr R.K.Brummitt of Kew, the Secretary of the *Flora of the World* project, showed unfailing interest, and without his support the present volumes would never have come into being.

JUNCACEAE

Juncaceae Juss., *Gen. Pl.* 43 (1789)

Type: *Juncus* L.

Perennial, usually rhizomatous, less often annual herbs, glabrous or with hairy leaf margins; rarely leaf abaxial surface with simple, many-celled trichomes. Silica bodies ±absent; oxalate raphides absent; stomata paracytic. Stem erect to ascending, rarely procumbent, usually terete, leafless or leaf-bearing. Leaves linear or filiform, spirally arranged, rarely distichous; sheath closed or open, often auriculate; auricles rarely joined to form a ligule-like structure; blades of basal leaves sometimes reduced (cataphylls). Inflorescence terminal, rarely pseudolateral (bract resembles a continuation of stem), compound, cymose or racemose, panicle-like or anthelate, many-flowered with flowers in many to one terminal heads or spike-like clusters; lower inflorescence bracts usually herbaceous; each branch with membranous bract and adaxial prophyll; flower bracteoles 1–2 or absent; rarely inflorescence reduced to a single terminal or lateral (subterminal) flower. Flowers small, usually up to 8 mm long (rarely to 40 mm), actinomorphic, hypogynous, usually hermaphrodite, rarely unisexual (dioecious or monoecious). Perianth segments 6, in two whorls, glumaceous, usually ±equal, free. Stamens 6 in two whorls or inner whorl reduced; filaments filiform to flattened; anthers 2-thecate, 4-sporangiate, oblong to linear, basifixated, dehiscence lateral; connective rarely with a projection; pollen in tetrads. Carpels 3, connate; ovary superior, unilocular or 3-septate to 3-locular; style 1, distally 3-branched (stigmas), papillae ±adaxial. Fruit an orbicular to oblong-ellipsoid loculicidal (rarely circumscissile) capsule. Seeds 3-many; endosperm starchy; embryo small, broadly cylindric; outer seed-coat hyaline, whitish to brownish, loose to adpressed, sometimes forming apical and/or basal appendages; inner seed-coat usually brown to castaneous.

Seven genera, c. 440 species, almost cosmopolitan, common from temperate to polar regions; mostly in the mountains in the tropics.

Closely related to the South African monotypic *Prioniaceae* (S.L.Munro & H.P.Linder, *Syst. Bot.* 23: 43–55 (1998)) and to *Thurniaceae* and *Cyperaceae* (D.Simpson, in P.J.Rudall *et al.* (eds.), *Monocot. Syst. Evol.* 497–509 (1995)).

G.Engelmann, A revision of the North American species of the genus *Juncus*, with a description of new and imperfectly known species, *Trans. Acad. Sci. St. Louis* 2: 424–458 (1866), 459–499 (1868); F.G.P.Buchenau, Monographia Juncacearum, *Bot. Jahrb. Rush Family, in *Flora of North America North of Mexico* 22: 211–267 (2000); Wu Guofang & S.E.Clemants, Juncaceae, in Wu Zhengyi & P.H.Raven, *Fl. China* 24, *Flagellariaceae through Marantaceae*, pp. 44–69 (2000).

Throughout the text, unless otherwise stated, the term seed is used for seeds excluding their appendages.

- 1 Flowers solitary; anthers mucronate (if anthers not mucronate then outer tepals at least 15 mm long); auricles never lacerate
- 2 Plants not cushion-forming; upper part of stem leafless; flower terminal
- 3 Flower bracts 2; lower bract herbaceous, conspicuously longer than perianth; upper bract \pm equalling perianth; capsule suborbicular to obovoid, obtuse, to c. 5 mm long; seeds without conspicuous appendages **1. Rostkovia**
- 3: Flower bracts 1 or 2, membranous, much shorter than perianth; capsule oblong to ellipsoidal, trigonous, acuminate, at least 7 mm long; seeds with two distinct appendages **2. Marsippospermum**
- 2: Plants cushion-forming; upper part of stem densely covered with leaves; flower lateral (subterminal, axillary)
- 4 Leaves regularly distichous; gynophore developed, elongating during capsule ripening **5. Distichia**
- 4: Leaves \pm spirally arranged; gynophore absent
- 5 Flower with 1 bracteole; leaf blade with margins finely denticulate, with apex acute but not hard nor prickly **4. Patosia**
- 5: Flowers with 2 bracteoles; leaf blade with smooth margins, with apex acute, hard, prickly **3. Oxychloë**
- 1: Flowers in multi-flowered inflorescences; anthers not mucronate (if flowers occasionally solitary then tepals shorter than 10 mm); if anthers minutely mucronate then auricles lacerate
- 6 Capsule 3-seeded; leaves densely to very sparsely ciliate; flowers always with basal bracteoles; leaf sheath closed, rarely partially dissected **6. Luzula**
- 6: Capsule many-seeded; leaves not hairy; flowers with or without bracteoles; leaf sheath open, rarely closed **7. Juncus**

1. ROSTKOVIA

Rostkovia Desv., *J. Bot. (Desvaux)* 1: 324 (1809)

Type: *Rostkovia magellanica* (Lam.) Hook.f.

Perennial herbs, erect, glabrous. Stems leafless. Leaves all basal, spirally arranged, linear or with reduced blade; stomata restricted to 2 narrow bands of lighter color, one on each side of the midrib. Flower bracts 2, with the longer one erect to suberect, much exceeding the flower, and the other \pm equalling tepals. Flower terminal (pseudolateral), single, large, hermaphrodite. Tepals castaneous-brown to dark brown; margins membranous, distally involute. Stamens 6; anthers linear; connective with apical mucro to 0.5 mm. Ovary sessile. Style with 3 tapering twining stigmas. Capsule subglobose, unilocular or slightly triseptate, sessile. Seeds many, \pm ovoid; appendage absent; base with a paler patch or apiculate; seed-coat with fine longitudinal pattern, with cells narrow elongated and pointed.

Two species, one endemic to Tristan da Cunha, the other distributed in New Zealand, the Sub-Antarctic Islands, the southernmost part of South America to Patagonia, and disjunctly in Ecuador.

Leaves up to 1 mm wide, straight, stiff, acute; style 2.5–4.0 mm

1. R. magellanica

Leaves usually 1.2–1.7 mm wide, arcuate to circinate, subacute-subobtuse; style 1.5–2.0 mm

2. R. tristanensis

JUNCACEAE

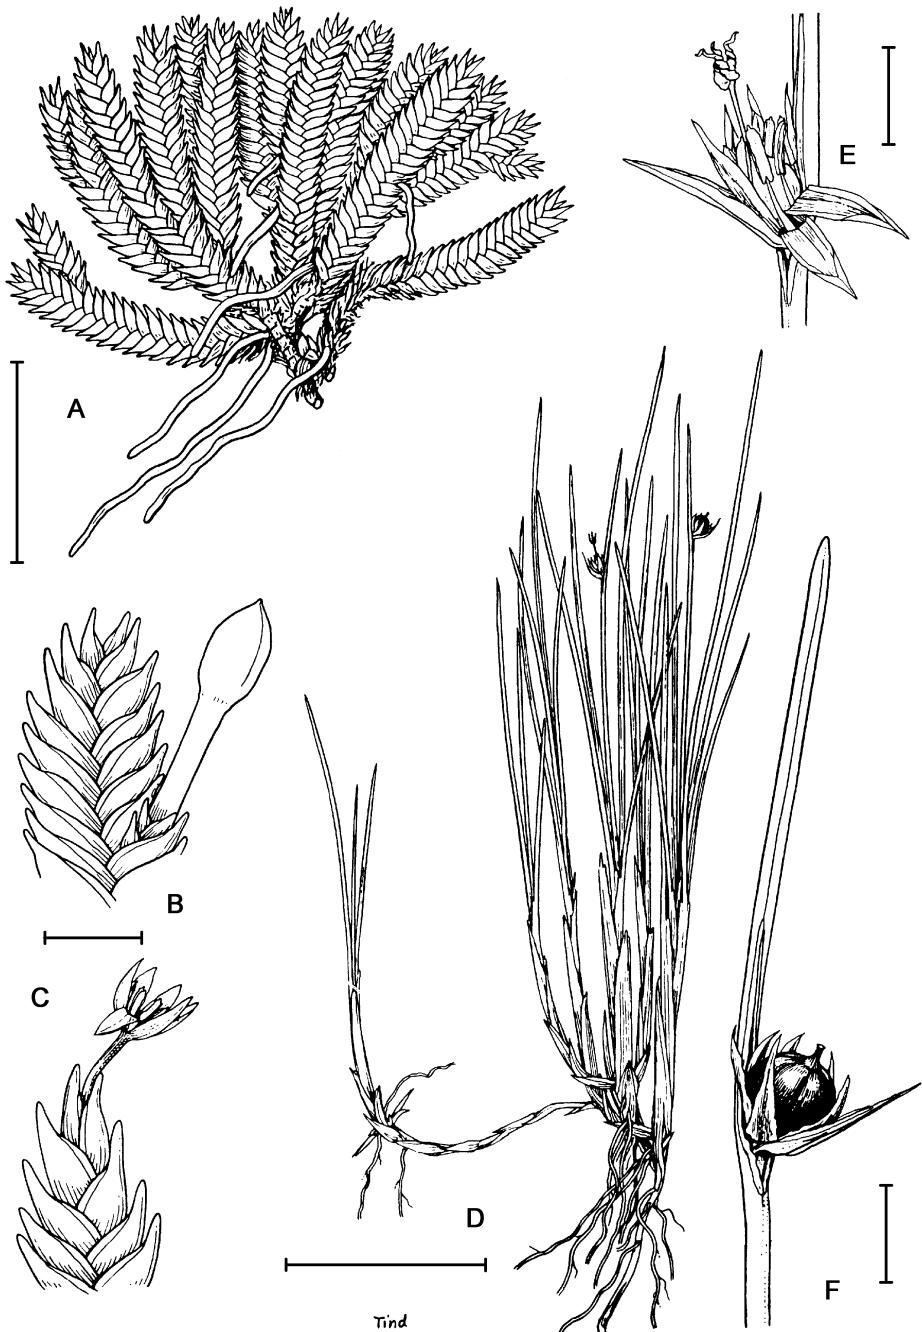

Figure 1. *Distichia muscoides*. **A**, habit; **B**, fruiting shoot showing the capsule lifted on gynophore; **C**, staminate flowering shoot (**A**, L.Holm-Nielsen et al. 6732, AAU; **B**, Øllgaard & H.Balslev 8435, AAU; **C**, Jameson s.n., K). *Rostkovia magellanica*. **D**, habit; **E**, flower; **F**, fruit. (**A-C**, B.Øllgaard & H.Balslev 9772, AAU). Scale bars: **A**, **D** = 5 cm; **B**, **C**, **E**, **F** = 2 mm. Drawn by K. Tind. Originally published in G.Harling & B.Sparre (eds.), *Fl. Ecuador* 11: 6, fig. 1 (1979), reproduced with permission, from H.Balslev, *Fl. Neotrop. Monogr.* 68: 40, fig. 20 (1996), © 1996, The New York Botanical Garden.

Juncus magellanicus Lam., *Encycl.* 3: 266 (1789); *Rostkovia sphaerocarpa* Desv., *J. Bot. (Desvaux)* 1: 327, pl. 12, fig. 2 (1809), *nom. illeg.* T: Chile. Magallanes: Magellan Strait, *P. Commerson s.n.*; holo: P, photo AAU; iso: P, US.

Rostkovia magellanica (Lam.) Hook.f. f. *pumila* Albov, *Revista Mus. La Plata, Secc. Bot.* 7: 353 (1896). T: Argentina, Tierra del Fuego, left bank of Rio Grande, 6 Mar 1896, *N. Albov 808*; holo: LP, photo NY; iso: SI.

Illustrations: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 40, fig. 34 (1906); M.Barros, *Darwiniana* 10: 306, fig. 8 (1953); H.Balslev, *Brittonia* 31: 244, fig. 1 (1979); H.Balslev, *Fl. Neotrop. Monogr.* 68: 40, fig. 20, D-F (1996).

Map: H.Balslev, *Brittonia* 31: 245, fig. 2 (1979).

Perennials, loosely caespitose, 15–30 cm tall; rhizome erect or ascending, sometimes short creeping, 1.5–2.5 mm diam., usually covered with brown 1.0–1.5 cm long scales inserted 0.5–1.0 cm apart. Stem 0.5–1.0 mm diam.; cataphylls 2–4 per stem, to 7 cm long, longitudinally ridged, light brown, with smooth red-brown margins; rudimentary blade to 4 mm long. Basal leaves 15–25 cm long, to 1 mm wide; tip acute; auricles c. 1 mm long, rounded; blades straight, stiff, ±flat, slightly trigonous or canaliculate, narrowly grooved along abaxial midrib. Flower bracts 2; lower bract long, herbaceous, 4 cm long; upper bract scale-like, to 1 cm long. Pedicel 1–3 mm long. Tepals equal, lanceolate, 6–7 mm long, dark reddish brown, gradually scarious toward the margin, obtuse, seemingly acuminate because of the involute scarious margins. Stamens c. 4.5 mm long; anthers c. 2.5–3.0 mm long, mucronate; filaments linear, flat, to 3 mm long, usually shorter than anthers; style 3.0–4.5 mm long; stigmas c. 2.5–3.0 mm long. Capsule c. 4 mm in diam., thick-walled, dark brown to black, shining. Seeds oblong to ovoid, c. 1.2–1.7 × 0.7–0.9 mm, dark, almost blackish, glossy with fine color pattern of longitudinal blackish rectangles. 2n=56, *fide* E.J.Beuzenberg & J.B.Hair, *New Zealand J. Bot.* 21: 15 (1983). Fig. 1.

Rostkovia magellanica occupies a wide and very disjunct range: New Zealand main islands and Antipodean Is., South Georgia, Falkland Islands, southernmost Chile and Argentina, and Ecuador. 51: ATP, NZS. 83: ECU. 85: AGS, CLS. 90: FAL, SGE. 2. *Rostkovia tristanensis* Christoph., *Results Norweg. Sci. Exped. Tristan da Cunha* 11: 3 (1944)

T: Tristan da Cunha, above Soggy Plain, 1100–1200 m, 19 Feb 1938, *Y.Mejland 1516*; holo: O, photo NY; iso: BM, GH, K, LD, O, S.

Illustrations: E.Christophersen, *Res. Norweg. Sci. Exped. Tristan da Cunha* 11: 4 and 5, figs. 2, 3 (1944).

Perennials, loosely caespitose, to 16 cm tall; rhizome creeping to ascending, often stoloniferous, covered with scales; stems erect, rigid, 0.7–1.0 mm in diam.; cataphylls coriaceous, with two prominent veins, to 3–5 cm long; rudimentary blade to c. 2 mm; basal leaves usually to 10–12 cm long, 1.2–1.7 mm wide, flat, canaliculate, arcuate to circinate, subobtuse to subacute. Flower bracts 2; lower bract 1.2–1.9 (–2.5) cm long; upper bract slightly shorter to ±equalling perianth. Pedicel short. Tepals subequal, lanceolate, castaneous-brown; margins membranous-stramineous, ±involute; outer tepals 8–10 mm long; inner tepals 7–9 mm long. Stamens 5–6 mm; anthers c. 2 mm long; filaments to 4 mm long; style 1.5–2.0 mm; stigmas 1.5–2.5 mm. Capsule obovoid, 4.5–5.5 mm long, ±brown, shining to dull. Seeds narrowly ovoid, 1.0–1.2 mm long, shining, with fine longitudinal pattern.

JUNCACEAE (*Rostokovia*)

Endemic to Tristan da Cunha. Known only from the rich type collection, 90: TDC Tristan da Cunha, above Soggy Plain, 19 Feb 1938, *Y.Mejland 1516* (BM, GH, K, LD, photo NY, O, S). Mountain *Empetrum* heathland at 1100–1200 m. Map 2.

On Gough Island (90. TDC), plants of intermediate character between *R. magellanica* and *R. tristanensis* were collected in 1956 [Hog's Tooth, c. 700 m, peat among trachyte blocks, *N.M.Wace 132* (BM)]. They approach the former in having narrow, straight, erect, stiff leaves and shorter tepals; they are close to *R. tristanensis* in short anthers (c. 1.7–1.9 mm), shorter than filaments, probably short stigmas and paler perianth colour. As both *R. tristanensis* and the Gough ls. plants are known from rather limited material, resolution of this discrepancy must await fuller collections. Possibly, *R. tristanensis* may vary in its leaf characters.

2. MARSIPPOSPERMUM

Marsippospermum Desv., *J. Bot. (Desvaux)* 1: 328 (1808); *Juncus* sect. *Marsippospermum* (Desv.) E.Mey., *Syn. Junc.* 52 (1822)

Type: *Marsippospermum calyculatum* Desv., *nom. illeg.*, = *Juncus grandiflorus* L.f.

Perennial herbs, erect, glabrous. Leaves 1–2 (–3) caudine; sterile shoots with 1–3 (–5) cauliform terete leaves; pith parenchymatous; cataphylls distinctly developed; stomatal lines distributed evenly. Flower bracts 1–2, short, membranous. Flowers borne singly, terminal, large, usually 10–40 mm long; tepals linear-lanceolate, acuminate, pale. Stamens 6; anthers linear, longer than filaments; connective with or without apical projection. Ovary sessile. Style with 3 ±tapering stigmas. Capsule oblong-trigonous or ellipsoid-trigonous, acuminate, imperfectly triseptate, with upper part recurved after dehiscence. Seeds many; seed-coat forming two long tail-like appendages.

Four species; one endemic to New Zealand, the others confined to southernmost South America and Falkland Islands.

- 1 Connective with a distinct apical projection at least 0.7 mm long; overall length of seeds less than 2.7 mm
- 2 Connective with an apical projection 1.8–2.0 mm long; outer tepals 1.1–1.5 cm long; leaves of sterile shoots c. 0.5 mm in diam.
 - [South America]
 - 4. *M. reichei*
- 2: Connective with an apical projection 0.7–0.9 mm long; outer tepals 1.7–2.7 cm long; leaves of sterile shoots 0.6–0.9 mm in diam.
 - [New Zealand]
 - 3. *M. gracile*
- 1: Connective ±without apical projection; overall length of seeds at least 4.0 mm
 - 3 Outer tepals usually 3.2–4.0 cm long; anthers usually 8–10 mm long; capsule 1.7–2.5 cm long; seeds 5.0–6.5 mm long including appendages
 - 1. *M. grandiflorum*
 - 3: Outer tepals usually 1.6–2.3 cm long; anthers usually 4–7 mm long; capsule 1.1–1.5 cm long; seeds 4.0–5.0 mm long including appendages
 - 2. *M. philippii*

Map: D.M.Moore, *Fl. Tierra del Fuego* 318 map 36 j (1993).

Perennials, loosely caespitose; rhizome stout, creeping, with internodes short, to 1–2 cm long; stems in rows, usually 25–40 (–60) cm long, c. 1.5 mm in diam. Cataphylls 2 (–3), loose, pale brown; sheaths obtuse; blade setiform, usually 2–4 mm; caudine leaf usually single; auricles short, obtuse. Leaves of sterile shoots single, cauliform, terete, equalling to much exceeding stems, c. 2 mm in diam., ±smooth to slightly striate; tip acute to subobtuse. Bracteoles 2, membranous, broadly ovate, obtuse, usually 2–4 mm long. Tepals linear-lanceolate, pale stramineous to scarious, irregularly unequal; outer tepals usually 3.2–4.0 cm long; inner tepals c. 2.0–2.5 (–3.5) cm long. Stamens 6, much shorter than perianth, usually 10–11 mm long. Anthers 8–10 mm long; pollen sacs slightly overtopping connective; tips later erecto-patent and hence anthers bicorniculate at apex. Filaments to c. 2 mm long. Style c. 5–6 mm long; stigmas 8–10 mm long. Capsule oblong-ellipsoidal, ±trigonous, acuminate, usually 1.7–2.2 (–2.5) cm long, pale brown, shining. Seeds pale brown, ±ellipsoidal, with body c. 1.0 mm long, 0.4–0.5 mm wide, or 5.0–6.5 mm long including the two whitish subequal tail-like appendages each 1.7–2.4 mm long. Fig. 2.

3. OXYCHLOË

Oxychloë Phil., *Fl. Atacam.* 52 (1860); *Distichia* sect. *Oxychloë* (Phil.) Benth. & Hook.f., *Gen. Pl.* 3: 867 (1883).

Type: *Oxychloë andina* Phil.

Andesia Hauman, *Anales Mus. Nac. Hist. Nat. Buenos Aires* 27: 287 (1915). T: *Andesia bisexualis* (Kuntze) Hauman

Perennial herbs, cushion-forming, glabrous; cushions dense, prickly. Rhizome branched, ascending. Stems ±erect, ±regularly forked, with proximal part densely covered with persisting wilted leaf bases. Leaves regularly and densely spirally inserted along stem; blade equal to or longer than sheath, terete, smooth, with apex acute, hard-pointed, prickly. Inflorescence reduced to a single lateral (axillary) subterminal flower with two scarious bracteoles; pedicel of variable length. Flowers unisexual or hermaphrodite (plants polygamous-dioecious or diclino-dioecious). Tepals glumaceous or papery with margins hyaline, lanceolate or ovate-lanceolate, often unequal. Staminate flower with 6 stamens shorter than or equalling tepals; anthers elongated, mucronate, much longer than the very short flattened ±triangular filament. Stigmas tapering. Capsule trilocular to triseptate, loculicidal to circumscissile. Seeds many, ovoid to pyriform; seed-coat distinct, forming inconspicuous appendage, whitish-yellowish, minutely reticulate, with cells slightly elongated longitudinally.

Five species at high altitudes of the Andes in South America, from Peru to north Patagonia in Argentina. The overall similarity among the species is high, the species are difficult to cultivate, and the genus requires a thorough taxonomic and population study.

- 1 Leaf blade 40–60 mm long 5. *O. mendocina*
- 1: Leaf blade 10–30 mm long
- 2 Leaf blade up to 20 mm long
- 3 Perianth c. 7–8 mm long; capsule 4–5 mm long, shorter than perianth; all flowers unisexual, with pistillate and staminate flowers on different shoots 3. *O. castellanosii*
- 3: Perianth to 5 mm long; capsule 8–10 mm long, exceeding perianth; hermaphrodite and unisexual flowers on different shoots 4. *O. haumaniana*
- 2: Leaf blade 20–30 mm long
- 4 Capsule 8–10 mm long, longer than perianth; seeds 1.0–1.3 mm long; all flowers unisexual, with pistillate and staminate flowers on different shoots 1. *O. andina*
- 4: Capsule c. 6 mm long, ±equalling perianth; seeds 0.6–0.8 mm long; hermaphrodite and unisexual flowers on different shoots 2. *O. bisexualis*

Monogr.* 68: 50, fig. 24 (1996), © 1996, The New York Botanical Garden.

long, slightly smaller than male; tepals 6.5–7.0 mm long, more broadly lanceolate; ovary turbinate; style c. 3 mm long; stigmas not exserted or slightly so, 1.0–2.5 mm long. Capsule unilocular, ellipsoid to oblong-obovoid, rounded at the apex, 4.0–5.0 mm long. Seed ellipsoidal, c. 0.8–1.0 mm long.

Endemic to the west of Argentina, in the Cuyo Region, San Juan Province, and La Rioja Province. 85: AGW. Humid bogs and slopes, wet plains and stream banks in high elevations, above 4000 m. Map 9.

85. ARGENTINA NORTHWEST: San Juan, Cuyo, Cordillera de Colanguil, Los Champones, *A.Castellanos* s.n. (W, isosyn., duplicates of LIL16042 & 16133); San Juan, Reserva San Guillermo, Mina Los Caranchos, 4000 m, *Pujalte* 103 (SI).

4. *Oxychloë haumaniana* (Barros) Barros, *Darwiniana* 10: 303 (1953)

Andesia haumaniana Barros, *Lilloa* 23: 419 (1950). T: Argentina, San Juan, Río Cura, 3900 m, 16 Feb 1950, *A.Castellanos*; holo: LIL16136.

Illustrations: M. Barros, *Darwiniana* 10: 304, fig. 7 (1953); M. Barros, *Lilloa* 23: 419, fig. 3 (1950).

Dense perennials, cushion-forming, 5–10 cm tall. Stem erect, much branched, covered with old sheaths, with living leaves only in distal part. Leaves imbricate, imperfectly distichous; sheaths brownish, 10–50 mm long, 4–7 mm wide; auricles asymmetrical, ligulate, membranous; blade narrowly cylindrical, rigid, surface minutely striate, 10–15 mm long, 1.0–1.2 mm wide; tip prickly. Bracteoles unequal; lower bracteoles subacute, 4–5 mm long, shortly mucronate; upper bracteoles subobtuse, c. 2.5 mm long. Flowers hermaphrodite or unisexual; perfect flowers on short peduncle, scarcely overtopping leaves; tepals acute, narrowly lanceolate, brownish-purplish with scarious margins, subequal, c. 5 mm long. Stamens 6; anthers c. 2.5 mm long, mucronulate; filaments 0.5–1.0 mm long. Unisexual flowers similar to the perfect ones, lacking one of the fertile whorls. Capsule hard-walled, ovoid, brownish, 8–10 mm long. Seeds obovoid, reticulate, whitish, 0.7–0.9 mm long.

Rare, endemic to San Juan Province in Argentina; known from the type collection only. 85: AGW. Wet slopes and plains in high Andes, at 3900 m. Map 10.

Similar to *O. bisexualis* but differs in having shorter leaf blade, up to 15 mm long, and smaller flowers, usually less than 5 mm.

5. *Oxychloë mendocina* Barros, *Lilloa* 28: 282, fig. 2 (1957)

T: Argentina, Mendoza, Tristeza, China Muerta, 23 Feb 1953, *A.Castellanos*; holo: LIL15365.

Illustration: M. Barros, *Darwiniana* 10: 304, fig. 7 (1953).

Dense perennials, compact, cushion-forming, usually to 8–10 cm tall. Stem erect, much branched, with basal internodes covered with old sheaths and fresh leaves only in the most distal part. Sheaths with membranous margins, 3–5 cm long; auricles forming a bilobed ligule; blade cylindrical, tapered into pugent apex, 4–6 cm long, 1–2 mm wide. Bracteoles unequal, ovate, membranous; lower bracteoles 4.5–5.0 mm long. Flowers hermaphrodite or unisexual, with the former on long filiform peduncles 3–5 cm long. Tepals lanceolate, purplish-castaneous, with margins membranous, subequal; outer tepals 7 mm long; inner tepals 7.5–8.5 mm long. Stamens 6; anthers mucronulate, 4.0–4.5 mm long; filaments 0.3–0.5 mm long. Female flowers with filiform staminodes; ovary turbinate; style c. 2 mm long, large; stigma exserted, c. 4–5 mm long. Capsule ovoid to ellipsoidal, 7.0–7.5 mm long, shorter than perianth. Seeds ellipsoidal, 0.8–0.9 mm long.

Endemic to Mendoza Province, W Argentina. 85: AGW. Humid bogs and springs, usually above 3500 m. Map 11.

85. ARGENTINA NORTHWEST: Mendoza, between Portezuelo de Rahui and valley of Chacaycó, *F.Kurtz* 6071 (CORD); Arroyo del Papel, 3000 m, *F.Kurtz* 11127 (CORD); Mendoza, San Carlos, Laguna del Diamante, *A.Ruiz Leal* 14561 (K).

JUNCACEAE

4. PATOSIA

Patosia Buchenau, *Bot. Jahrb. Syst.* 12: 63 (1890)

Distichia sect. *Patosia* (Buchenau) Kuntze in T.E. von Post & C.E.O.Kuntze, *Lex. Gen. Phan.* 182 (1903).
T: *Patosia clandestina* (Phil.) Buchenau

Perennial herbs, cushion-forming, glabrous. Stems ±regularly forked, dying back from the base, densely covered with persisting wilted leaves. Leaves regularly, densely, and alternately inserted along stem. Blade equal to or slightly shorter than sheath, flat or canaliculate; margins usually finely dentate. Inflorescence reduced to a single lateral sub-terminal flower. Plants dioecious or rarely with a few perfect flowers. Flower bracteole single. Tepals linear to lanceolate. Staminate flowers long pedicellate, exserted above the cushion; stamens 6, with long linear mucronate anthers on short filaments. Pistillate flowers sessile in axil of subapical leaf; ovary sessile; style long, filiform, with 3 filiform papillose stigmas. Capsule triseptate, sessile, narrowly ellipsoid. Seeds many; outer seed-coat spongy, irregularly wrinkled; inner seed-coat castaneous, hard.

A single species distributed along the Andes from Bolivia to Chile and Argentina.

Perennials forming dense, very hard cushions up to several meters in diam. and 0.5 m high. Individual plants 5–15 cm long, ±regularly forked; stems covered with short spirally arranged wilted leaves and a few green leaves distally. Leaves 1.5–2 cm long, inserted 1–2 mm apart; sheaths as long as or longer than the blade, to 5 mm wide; auricles obtuse, sometimes fused and liguliform; blade linear, 0.5–0.7 mm wide, acuminate, proximally canaliculate, terete in the middle, distally flat with finely serrate margin; leaf seemingly jointed. Staminate flowers exserted on filiform pedicels 1–2 cm long; bracteole 4.0–4.5 mm long, tepals subequal, 5–7 mm long; anthers 2.5–3.5 mm long, mucronate; filaments c. 0.2–0.3 mm long. Pistillate flowers sessile and hidden in axil with only stigmas exserted above the cushion; tepals linear to lanceolate, to 18 mm long; ovary ellipsoid, to 2 mm long, tapering to the filiform 10 mm long style; stigmas 3, filiform, to 8 mm long, papillose, not tapering, exserted. Capsule narrowly ellipsoid, acuminate, 10 × 2 mm. Seeds of irregular shape. Fig. 4.

Confined to the high Andes from Bolivia to N and C Chile and from Jujuy to Neuquén, NW and SW Argentina. 83: BOL. 85: AGW, AGS, CLN, CLC. Alpine bogs, along streams, and in wet depressions, usually 3000–4000 m. Map 12.

JUNCACEAE

5. DISTICHLIA

Distichia Nees & Meyen, in F.J.F.Meyen, *Observ. Bot.* 128 (1843)

Type: *Distichia muscoides* Nees & Meyen

Goudotia Decne., *Ann. Sci. Nat., Bot., Sér. 3, 4:* 83 (1845); *Distichia* Nees & Meyen sect. *Goudotia* (Decne.) Benth. & Hook.f., *Gen. Pl. 3:* 367 (1883). T: *Goudotia tolimensis* Decne.

Agapatea Steud., *Bot. Zeitung (Berlin)* 14: 391 (1856), nom.inval.; *Agapatea* Steud. ex Buchenau, *Abh. Naturwiss. Vereine Bremen* 4: 124 (1874), nom. inval.

Perennials with branched suberect rhizomes, glabrous, cushion-forming. Stems ±regularly forked and covered with persisting leaves which are wilted in proximal part and live in the most distal part. Leaves regularly densely and strictly distichously inserted along stem, with a wide sheath clasping the leaf above; blade shorter than or equalling sheath, terete. Inflorescence reduced to a single lateral subterminal flower. Plants dioecious. Bracteoles 2–4, minute, scarious. Tepals lanceolate, 4–10 mm long. Staminate flower long pedicellate. Stamens 6, with linear mucronate anthers about 10 times as long as the filaments. Pistillate flower short pedicellate; ovary on short gynophore; style with 3 filiform papillose stigmas. Capsule unilocular, lifted on a gynophore at ripening. Seeds many; outer seed-coat loose, irregularly wrinkled.

Three species confined to the high Andes from Colombia and Ecuador to N Chile and N Argentina.

Perennials forming dense hard cushions up to several meters in diam. Single plants 5–15 cm long, with ±regularly forked shoots, covered with short, strictly distichous persistent stramineous or rarely dark brown wilted leaves, with only 2 or 3 most distal leaves green and projecting above the cushion. Leaves 1–2 cm long, inserted 1–2 mm apart; sheaths usually two thirds of entire leaf length, open, wide, V-shaped in T.S., with narrow and scarious margins, almost completely clasping the sheath of the leaf above; blade bluntly acute. Flowers in a subterminal leaf axil. Tepals subequal, 4.5–7.5 mm long. Staminate flowers on filiform pedicels 1–2 cm long. Stamens 2.0–3.5 mm long; anthers 1.8–3.0 mm long; filaments c. 0.2–0.3 mm long. Pistillate flowers hidden in the sheath of the supporting leaf, with only stigmas projecting above the shoot apex; style filiform, exceeding tepals; stigmas half as long as style. Gynophore elongating at fruit ripening, lifting the capsule slightly above the cushion. Capsule ellipsoid to ovoid, apically acute to slightly apiculate or obtuse, 5–7 × 2.5–3.5 mm, irregularly dehiscing, yellow-brown, unilocular. Seeds oblong, 1.0–1.5 × 0.5–1.0 mm, covered by the thick white outer seed-coat. Fig. 1, 5.

Map: H.Balslev & S.Laegaard, *Nord. J. Bot.* 6: 153, fig. 2 (1986).

Perennials forming loose cushions up to 50 cm in diam. Individual plants consisting of ±regularly forked shoots 5–15 cm long; proximal parts covered with stramineous wilted leaves; distal part with 6–8 green leaves. Leaves 1–2 cm long, completely clasping one another by the sheaths; sheaths equaling blades or shorter, 1.0–2.5 mm wide, U-shaped in T.S., with margins scarious; auricles pointed or rounded, 1–3 mm long, papery; blade linear, terete, 0.5–1.0 mm wide; apex drawn out into a long pointed tip. Staminate flower pedicels 1.5–3.0 cm long; tepals linear-lanceolate, 5–8 mm long; stamens 2–6 mm long; gynoecium rudimentary, c. 1.5 mm long. Pistillate flower on pedicel c. 1 mm long; tepals linear-

lanceolate 7–10 mm long; ovary ovoid, c. 1 × 0.5 mm long; style 4–6 mm long; stigmas 5–7 mm long. Fruit and seed unknown. Fig. 5.

Found in the Western Cordillera of the Ecuadorian Andes at 1–3° S latitude. 83: ECU. High altitude spring bog areas, in seeping water, along streams, 3200–4200 m. Map 15.

83. 6. LUZULA

Luzula DC. in J.B.A.P. de M. de Lamarck & A.P. de Candolle, *Fl. Franç.*, 3rd edn, 3: 158 (1805), *nom. cons.*

Juncoides Ségr., *Pl. Veron.* 3: 88 (1754), *nom. rejic.* T: *Luzula campestris* (L.) DC.

Luzula sect. *Gymnodes* Griseb., *Spic. Fl. Rumel.* 2: 405 (1846); *Gymnodes* (Griseb.) Fourr., *Ann. Soc. Linn. Lyon*, sér. 2, 17: 172 (1869); *Juncoides* sect. *Gymnodes* (Griseb.) Kuntze in T.E. von Post & C.E.O. Kuntze, *Lex. Gen. Phan.* 303 (1903). T: not designated.

Nemorinia Fourr., *Ann. Soc. Linn. Lyon*, sér. 2, 17: 172 (1869). T: *Luzula forsteri* (Sm.) DC. [see *Luzula* subg. *Pterodes*]

Perennial (rarely annual) herbs, rhizomatous, seldom cushion-forming, with sparsely to densely ciliate leaves, rarely leaves abaxially hairy; trichomes simple, many-celled. Leaves scale-like on rhizomes, bractlike below the inflorescence, usually narrowly linear, rarely linear-lanceolate, flat to concave; sheaths closed (rarely slightly dissected); auricles absent. Bracts leaf-like to scarious. Inflorescence diverse, usually many-flowered, either cymose with flowers borne singly and pseudo-paniculate, or racemose and then borne singly or in few-flowered clusters in much branched panicles or decomound anthelate inflorescences, or in spike-like clusters, either pedunculate or congested in many-flowered dense heads. Each flower subtended by a small bract at pedicel base and 1–2 subtirent to fimbriate bracteoles just below flower. Flowers hermaphrodite, perfect. Tepals 6, equal to ±unequal, ±lanceolate (linear-lanceolate to ovate-lanceolate), glumaceous, glabrous or ciliate-fimbriate. Stamens 3–6; anthers oblong to linear; filaments filiform to linear; ovary sessile; style thin, 0.1–c. 4 mm long; stigmas 3, suberect, twining. Capsule ±ovoid-trigonous, unilocular. Seeds 3, with or without appendages (caruncula); outer seed-coat tight, usually hyaline, less often whitish or brownish. $x = 6$ (sometimes changed by fragmentation, mostly simultaneous (agmatoploid), or fusion ($x = 3$)), *fide* H.Nordenskiöld, *Hereditas* 37: 325–355 (1951), 42: 7–73 (1956).

A genus of 115 species, almost cosmopolitan, much rarer in the tropics, with major diversity centres in SW Europe, the Far East, W North America, temperate South America (the Andes) and Australia and New Zealand. Not important economically.

F.G.P. Buchenau, Monographia Juncacearum, *Bot. Jahrb. Syst.* 12: 1–495 (1890); F.G.P. Buchenau, Juncaceae, in H.G.A. Engler, *Pflanzenr.* (iv.36) Heft 25: 1–284 (1906); H.Nordenskiöld, Cyto-taxonomical studies in the genus *Luzula* I, II, *Hereditas* 37: 325–355 (1951), 42: 7–73 (1956); L.Hämet-Ahti, A synopsis of the species of *Luzula*, subgenus *Anthelaea* Griseb. (Juncaceae) indigenous in North America, *Ann. Bot. Fenn.* 8: 368–381 (1971); V.S. Novikov, Konspekt sistemy roda *Luzula* DC. (Juncaceae), *Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol.* 95(6): 63–70 (1990); J.Kirschner, An account of natural hybridization within *Luzula* sect. *Luzula* (Juncaceae) in Europe, *Preslia* 63: 81–112 (1991); J.Kirschner, Karyological differentiation of *Luzula* sect. *Luzula* in Europe, *Thaiszia* 2: 11–39 (1992); J.Kirschner, Taxonomic survey of *Luzula* sect. *Luzula* (Juncaceae) in Europe, *Folia Geobot. Phytotax.* 28: 141–182 (1993).

The genus is characterized by chromosomes with diffuse or polycentric centromeres, and, during its evolution, it undergoes (often repeatedly) a simultaneous chromosome

JUNCACEAE (*Luzula*)

fragmentation. The phenomenon is called agmatoploidy; in consequence, a mere chromosome number does not give information about the ploidy level. Chromosome numbers are therefore given with data on karyotype; unfragmented chromosomes are designated AL, half-sized chromosomes BL and quarter-sized ones are called CL.

For the compilation of descriptions, seeds were measured in dorsal view, seed length excludes the appendage, and lower flowers of clusters were examined for floral traits (tepals and capsule segments first liberated from inflorescence).

KEY TO SUBGENERA AND SECTIONS

- | | | |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| 1 | Annuals; inflorescence cymose; n = 3 | subg. 1. Marlenia |
| 1: | Perennials; inflorescence racemose; n = 6 | |
| 2 | Seed appendage apical (distal), large | subg. 3. Pterodes |
| 2: | Seed appendage basal or absent, but distal end of seed sometimes with a minute pale patch of loose outer seed-coat | |
| 3 | Flowers usually borne singly in the inflorescence, rarely some in groups of 2–5; inflorescence much branched | sect. 4. Diprophyllatae |
| 3: | Flowers in dense pedunculate clusters or wholly congested, or in groups of (2) 3–5 (to many) flowers in the whole inflorescence; inflorescence sparsely branched, unbranched or much branched | |
| 4 | Leaf tip obtuse to subobtuse, often slightly swollen, rarely with a spinuliform mucro | |
| 5 | Leaf tip obtuse, not swollen, with a spinuliform mucro | 49. <i>Luzula nivalis</i> |
| 5: | Leaf tip obtuse or subobtuse, slightly swollen or not swollen, without spinuliform mucro | sect. 7. <i>Luzula</i> |
| 4: | Leaf tip acute to acuminate, not swollen | |
| 6 | Inflorescence usually nodding, less often erect (then stamens 3 or tepals ciliate; high Andes), spike-like or paniculate (a panicle of ±dense spike-like clusters), clusters congested or interrupted at base | sect. 5. Alpiniae |
| 6: | Inflorescence erect to suberect, if slightly nodding then much branched, loose, of (2) 3–5 (20)-flowered groups, anhelate (or corymbose) or umbelloid, of distinct clusters (if congested then stamens 6, tepals glabrous; N hemisphere) | |
| 7 | Inflorescence much branched, (doubly) anhelate, terminal groups mostly of 2–4 (8) flowers, head-like | sect. 1. Anthelaea |
| 7: | Inflorescence sparsely branched or unbranched, umbelloid to subcongested, of distinct pedunculate clusters (or wholly contracted), clusters 3–8 (–many)-flowered | |
| 8 | Tepals ±membranous; seeds ±globose, smooth | sect. 2. Atlanticae |
| 8: | Tepals coloured (usually castaneous-brown); seeds broadly ovoid to ellipsoid, surface sculptured | |
| 9 | Seeds 1.7–1.9 × 1.3–1.4 mm; rhizome thick, nodulose | sect. 3. Nodulosae |
| 9: | Seeds 0.9–1.3 × 0.5–0.3 mm; rhizome thin or indistinct | |
| 10 | Leaf margin smooth | 91. <i>L. acutifolia</i> |
| 10: | Leaf margin densely papillose-serrulate | sect. 6. Thyrsanochlamydeae |

Subg. 1. MARLENA

Luzula subg. **Marlenia** Ebinger, *Brittonia* 15: 173 (1963)

Ebingeria Chrték & Křísa, *Preslia* 46: 210 (1974). T: *Luzula elegans* Lowe

Luzula sect. *Tripophyllatae* Satake in T.Nakai & M.Honda, *Nov. Fl. Jap.* 1: 25 (1938). T: *Luzula purpurea* E.Mey.

Annuals. Leaves acute; apex extending to a hair, sometimes two hairs; leaf margin without sclerenchyma. Inflorescence cymose; flowers borne singly, terminal. Endodermis with walls evenly thickened (O-shaped in T.S.). Seeds smooth; appendage absent. n = 3.

A monotypic, remarkably distinct subgenus. The only species, *Luzula elegans*, is native to Macaronesia and introduced to Portugal.

1. *Luzula elegans* Lowe, Trans. Cambridge Philos. Soc. 6: 532 (1838)

Ebingeria elegans (Lowe) Chrték & Křísa, *Preslia* 46: 211 (1974). T: [Madeira] ‘in rupibus convallium Maderae murisque rarior’; [no locality] 8 May 1838, R.T.Lowe 646; syn: BM.

Illustration: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 50, fig. 40 (1906); J.E.Ebinger, *Brittonia* 15: 170, fig. 1, 3, 172, fig. 5, 8, 9 (1963).

Map: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 87 (1965).

Annuals, usually 1–2-stemmed, 8–17 (–25) cm. Basal leaves several, to 12 cm long, 1.2–2.8 mm wide. Cauline leaves 2–4, to 10 cm long, to c. 2.5–3.0 mm wide; margins ±smooth, sparsely hairy, with hairs long, especially near sheath mouth; apex acute, usually ±extended to a single or sometimes two hairs. Inflorescence bract herbaceous, c. 2–4 cm long, surrounding pseudorhachis; middle bracts purplish-membranous with scarious ciliate margins. Bracteoles purplish-membranous, ovate, acuminate, c. 2.0–2.5 mm long. Inflorescence a loose divaricate panicle usually 5–13 cm long, almost evenly branched or distally denser; branches thin, smooth; flowers borne singly. Tepals ±equal or outer slightly longer, ±ovate, with outer tepals purplish with decreasing colour intensity towards membranous margins, (2.4–) 2.7–2.9 (–3.2) mm long, acute and mucronate; midrib usually distinctly papillose near apex; inner tepals wholly translucent-membranous or midrib purplish; apex usually emarginate and mucronate. Stamens 6; anthers 0.3–0.5 mm long; filaments 0.4–0.8 mm long; style 0.2–0.3 mm long; stigmas 0.3–0.5 mm long, not exerted. Capsule ovoid-subglobose, pale brown to pale purplish, thin-walled, ±acute to subobtuse; segments 1.4–1.8 mm long, c. 1.3–1.5 mm wide; mucro short. Seeds subglobular 0.8–0.9 × 0.6–0.7 mm long, smooth, shining, pale castaneous-brown; appendage absent. 2n=6, *fide* N.Malheiros & D.Castro, *Nature* 160: 156 (1947); H.Nordenskiöld, *Hereditas* 37: 327 (1951).

Native to Madeira, Canary Is. (Gran Canaria, Tenerife, Gomera, Hierro, La Palma), naturalized in Portugal (Estremadura and Coimbra). 12: por. 21: CNY, MDR. On rocks, walls, dry slopes, along paths. Map 16.

12. PORTUGAL: Coimbra, 1879, *Moller* (WU); Estremadura, Sacavém, Quinta dos Almásteres, 26 Apr 1946, *Fontés* & *Rainha* (LD). 21. Exs. Canar.J* 2907 (LD, P, PR); La Palma, Barranco de las Angustias, 1000 m, Mar 1906, *C.-J.M.Pitard* 694 (SAM)]. MADEIRA: Madeira, between Ribeira Frio and Balcoes, 1100 m, 29 Apr 1952, *G.Een* & *Persson* (S); Madeira, São Roque, *G.Mandon* [*Pl. Mader.J* 248 (K, P, PR)]

In many respects close to the N African *Luzula atlantica* (2n=12). The chromosome number of *L. elegans* is unique in the genus, and there is a plausible suggestion that the number is a result of chromosome fusion.

JUNCACEAE (*Luzula*)

Subg. 2. LUZULA

Luzula B. *Stachyophora* C.Koch, *Linnaea* 21: 625 (1848). T: not designated [sections *Alpinae*, *Anthelaea* and *Luzula* represented].

Perennials. Leaves with acute, mucronate or obtuse tips. Inflorescence racemose; flowers borne singly in much branched decompound inflorescences, or in few- to many-flowered head-like groups, or in pedunculate clusters, sometimes wholly congested. Endodermis of cells with U-shaped thickened walls in T.S. Seeds finely reticulate or smooth; appendages basal or ±absent.

Sect. 1. ANTHELAEA

Luzula* sect. *Anthelaea Griseb., *Spic. Fl. Rumel.* 2: 404 (1846)

Luzula subg. *Anthelaea* (Griseb.) Buchenau, *Bot. Jahrb. Syst.* 1: 113 (1880); *Juncoides* sect. *Anthelaea* (Griseb.) Kuntze, in T.E. von Post & C.E.O.Kuntze, *Lex. Gen. Phan.* 303 (1903); *Luzula* subsect. *Anthelaea* [Griseb.] Novikov, *Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol.* 95(6): 66 (1990). T: *Luzula maxima* (Reichard) DC.; lecto, designated here.

Luzula maxima (Reichard) DC., *Preslia* 46: 211 (1974). T: *Luzula luzuloides* (Lam.) Dandy & E.Willm.

Perennials, usually with ascending branched rhizomes. Leaves with acute tips. Lower bract herbaceous. Inflorescence decompound, an anthela of anthelas. Terminal clusters usually of 2–4 flowers, tepals usually 2.5–5.5 mm long. Seed appendage basal, short, 0.1–0.2 mm, fibrillate.

A mostly European section with 10 species centred to the Alps, SW Europe and Macaronesia. Most of the species are endemics confined to small areas.

- 1 Tepals conspicuously unequal, with inner ones longer
- 2 Tepals white
 - 3 Tepals (2.0–) 2.3–3.2 mm long 9. ***L. luzuloides***
 - 3: Tepals 4.2–5.5 mm long 6. ***L. nivea***
 - 2: Tepals yellow, purplish, coppery-coloured or grey-brownish
 - 4 Tepals yellow; flower clusters usually 10–15-flowered, glomeruliform; tepals up to 3.2 mm long 8. ***L. lutea***
 - 4: Tepals purplish, brownish-purplish or coppery-coloured (later sometimes becoming grey-brownish); flower clusters 2–8-flowered; tepals usually longer than 3.5 mm
 - 5 Tepals 4.4–5.0 mm, purplish or bright copper-coloured; style 1.4–1.6 mm long; stigmas 1.0–1.4 mm long 3. ***L. purpureosplendens***
 - 5: Tepals 3.0–4.2 mm, copper-coloured or brownish-purplish; style 0.8–1.2 mm long; stigmas c. 0.6–1.1 mm long 9. ***L. luzuloides***
- 1: Tepals equal or subequal
 - 6 Bracteoles linear-lanceolate, at least 3.5 mm long; tepals 5.0–6.5 mm long. [Madeira] 2. ***L. seubertii***
 - 6: Bracteoles ovate or ovate-lanceolate, up to 3 mm long; tepals up to 5 mm long, usually much shorter
 - 7 Flowers white, dirty white, cream-white or whitish membranous
 - 8 Inflorescence dense, ±subcontracted; flower clusters usually (3–) 5–15-flowered
 - 9 Basal leaves 3–4 mm wide; capsules 1.9–2.2 mm long including mucro; abaxial leaf surface hairy or glabrous, with margins ciliate 4. ***L. lactea***

- 9: Basal leaves 13–19 mm wide; capsules c. 2.5 mm including mucro; abaxial leaf surface glabrous, with margins often subglabrous 5. *L. canariensis*
- 8: Inflorescence lax or ±dense, ±evenly branched, not subcontracted; flower clusters 2–5 (–7)-flowered
 - 10** Anthers bifurcate in distal 1/5–1/3; bracteoles 2.0–2.5 mm long 7. *L. pedemontana*
 - 10:** Anthers not bifurcate; bracteoles 1.0–1.5 mm long 9. *L. luzuloides*
- 7: Flowers ±brown, castaneous-brown, brownish copper-coloured or membranous with castaneous-brown midrib
 - 11** Style 0.8–1.2 mm long; stigmas less than 1.5 mm long; tepals with purplish or coppery colour/tinge 9. *L. luzuloides*
 - 11:** Style 1.6–2.2 mm long; stigmas longer than 2 mm; tepals without purplish or coppery colour/tinge 10. *L. sylvatica*

2. *Luzula seubertii* Lowe, *J. Bot. (Hooker)* 8: 300 (1856)

Juncoides seubertii (Lowe) Kuntze, *Revis. Gen. Pl.* 2: 724 (1891). T: 'In salebrosis rupestribus umbrosis Maderae'. Madeira, Serra do Seixal, Cruzinhas, 23 Jul 1855, R.T.Lowe; lecto: K, designated here; isolecto: P; other authentic specimens from type locality: K, LD.

Illustration: M.J.Cannon, in J.R.Press & M.J.Short, *Fl. Madeira*, plate 53, fig. 4 (1994).

Map: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 87 (1965).

Perennials, usually 40–80 cm tall, densely ciliate, loosely caespitose; rhizome creeping to ascending, long, often with dark fibrous cover; stolons ascending. Basal leaves few, up to 35–40 cm long, usually (6–) 8–11 mm wide; sheaths brown. Cauline leaves 3–5; upper leaves usually 5–8 cm long, 3–5 mm wide. All leaves with acuminate tip; margins ±smooth. Lower bracts ±herbaceous, 2–7 cm long; apex long acuminate, much shorter than inflorescence. Inflorescence decompound lax, with slightly drooping rich anthela to 15 cm long; branches smooth; terminal parts of inflorescence branches anhelate; terminal flower groups loose (1–4-flowered); peduncle visible and usually (0.5–) 1.5–5.0 (–8.0) mm long. Bracteoles linear-lanceolate, long acuminate, carinate, membranous to pale straw-brown, sparsely long ciliate, 3.5–5.5 mm long. Tepals linear-lanceolate, gradually tapering to long acuminate tip, equal to subequal, usually (5.0–) 5.5–6.5 mm long, pale straw-brown with membranous margins. Stamens 6; anthers 1.3–1.6 mm long; filaments c. 1.0 mm long; ovary 1.2–1.3 mm long; style 1.0–1.3 mm long; stigmas 1.5–2.8 mm long. Capsule pale brown, ±shining, ovoid, ±acuminate; mucro c. 0.3–0.5 mm long; capsule segments 2.8–3.0 × 1.6–1.9 mm. Seeds oblong-ovoid, dark brown, 1.3–1.4 mm long, 0.9–1.0 mm wide; appendage brownish, 0.1–0.2 mm long, fibrillate. 2n=12, fide N.Malheiros & A.Gardé, *Agron. Lusit.* 9: 76 (1947).

Endemic to mountains of Madeira. 21: MDR. Dry mountain grassland and shrubby slopes, usually on rocky ground. Map 17.

21. MADEIRA: Serra do Seixal, Cruzinhas, 18 Jul 1850, R.T.Lowe (LD, K); Serra do Seixal, Cruzinhas, 30 May 1863, R.T.Lowe (BM, K); Mt Torrinhos, 29 Jun 1828, P.B.Webb (K); Boco de Boroaca, Pico dos Arrieros, 1200–1500 m, G.Mandon [*Pl. 3. *Luzula purpureosplendens* Seub., *Fl. Azor.* 23 (1844)

Luzula elegans Guthnick [in C.F.F.Hochstetter] ex E.Mey., *Linnaea* 22: 392 (1849), nom. illeg.; *Luzula purpurea* H.C.Watson, *London J. Bot.* 3: 608 (1844), nom. illeg. T: Azores, H.J.Guthnick [in C.F.Hochstetter, *Herb. Azor.*] 126; lecto: K, designated here; isolecto: BM, P, W.

Luzula azorica H.C.Watson, *London J. Bot.* 2: 408 (1843), nom. inval. Authentic material: Azores, 1842, H.C.Watson; K.

Illustration: M.A.Seubert, *Fl. Azor.*, Plate iv, fig. 2. (1844).

Perennials, 25–45 (–60) cm tall, caespitose to loosely caespitose; rhizome ascending, branched; stolons numerous, ascending, with bases covered with brown to purplish castaneous-brown cataphylls. Basal leaves numerous, usually 15–22 cm long, 3–4.5 (–6) mm

JUNCACEAE (*Luzula*)

wide. Cauline leaves 1.5–3.5 (–8.0) cm long. All leaves subulate; margins ±smooth, ciliate to glabrescent, slightly swollen. Lower bract subherbaceous, erect, 1.2–2.5 cm long, much shorter than inflorescence. Inflorescence decompound, ±erect, usually 4–5 × 3–4 cm, dense, with each main branch bearing anthela of short pedunculate usually 2–6-flowered clusters. Bracteoles purplish membranous to pale grey, ±lanceolate, sparsely ciliate, 2.5–3.0 mm long. Tepals narrowly oblong-lanceolate, glabrous, ±unequal, with inner tepals often conspicuously longer, 4.4–5.0 mm long, purplish-coppery with hyaline margin, later becoming greyish pale brown; midrib often pale. Stamens 6; anthers 1.6–1.9 mm long; filaments c. 0.5 mm long; style c. 1.4–1.6 mm long; stigmas 1.0–1.4 mm long. Capsule subglobular, abruptly narrowing to mucro 0.3–0.5 mm long, dark castaneous-brown, shining; capsule segments 1.8–2.0 × c. 1.2 mm including mucro. Seeds dark brown, oblong-ovoid, c. 0.9 mm long, 0.7–0.8 mm wide; appendage indistinct, c. 0.1 mm long, fibrillate.

Endemic to the Azores. 21: AZO. Open broad-leaved woodlands, shrubby slopes, deforested mountain summit areas. Map 18.

21. Juncus lacteus Link, *J. Bot. (Schrader)* 2: 316 (1799); *Juncus brevifolius* Link ex Rostk., *De Junco* 35 (1801); *Luzula brevifolia* (Rostk.) Poir., *Encycl., Suppl.* 3: 532 (1813); *Juncoidea lactea* (Link) Kuntze, *Revis. Gen. Pl.* 2: 724 (1891). T: [Portugal] ‘zwischen den Felsen am Gerez’ [Serra do Gerês], *J.H.F.Link*; holo: B-W.

Maps: P.Montserrat, *Anales Inst. Bot. Cavanilles* 21(2): map 2 (1964); H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 87 (1965).

Perennials, usually 30–55 cm tall, loosely caespitose; rhizome ±creeping; stolons subterranean, ±ascending, to 12 cm long, with brown cataphylls and sparse fibrous cover. Basal leaves usually 8–15 cm long, often circinate, flat, c. 3–4 mm wide; caudine leaves 3–5, usually 3–7 cm long, c. 2 mm wide; sheaths dissected, ±dilated above, membranous bordered, ±abruptly narrowing to blade. All leaves with subulate apex; margins papillose-serrulate. Lower bract usually 2.0–3.5 cm long, subherbaceous, shorter or rarely ±longer than inflorescence. Inflorescence decompound, dense, usually 2–5 × 1.5–5 cm, with each main branch bearing dense anthela of 5–30 glomerate (usually 5–15-flowered) clusters. Bracteoles ±membranous, transparent, ovate-lanceolate, 2.5–3.0 mm long, sparsely ciliate. Tepals ±equal, glabrous, oblong-lanceolate, (4.0)–4.2–4.6 (–5.2) mm long, ±white, subtransparent-ivory white to dirty whitish; midrib sometimes prominent. Stamens 6; anthers 1.1–1.5 (–1.8) mm long; filaments 1.5–1.9 mm long; style 1.9–2.2 mm long; stigmas 0.6–1.1 mm long. Capsule narrowly ovoid, acuminate, mucronate, castaneous-brown, shining; capsule segments 1.9–2.2 × c. 1.0 mm, including mucro 0.2–0.4 mm long. Seeds ellipsoidal, pale brown, shining, ±paler apically, 1.0–1.1 mm long, c. 0.6 mm wide; appendage 0.1–0.2 mm long, fibrillate.

Confined to the mountains of Spain and Portugal. Two taxa are recognized on the basis of the leaf indumentum; intermediates in the southern part of the geographical range, and occasional coexistence of the two varieties within populations, suggest that this character is of doubtful taxonomic value. A late flowering species. Reported from Azores but no material seen (probably a misidentification of a late, ±greyish-flowered *L. purpureosplendens*).

Abaxial surface of leaves glabrous, with margins ciliate

4a. var. *lactea*

Abaxial surface of (at least some) leaves densely hairy

4b. var. *velutina*

4a. *Luzula lactea* (Link) E.Mey. var. *lactea*

5. *Luzula canariensis* Poir., *Encycl.*, *Suppl.* 3: 532 (1813)

Juncoides canariensis (Poir.) Kuntze, *Revis. Gen. Pl.* 2: 724 (1891). T: Canary Is., Tenerife, Laguna, *Broussonnet*; holo: P-DESF, n.v.

Map: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 87 (1965).

Perennials 35–90 cm tall, loosely caespitose, subglabrous; rhizome long, creeping to ascending; stolons present; plant base often purplish. Stem thick, c. 2–3 mm in diam. Basal leaves usually 18–30 cm long, 13–19 mm wide, evenly narrowing; cauline leaves usually 4–5, up to 18 cm long and 13 mm wide. All leaves acute; margins papillose-serrulate; sheaths ±dissected, with mouth ciliate. Lower bract 2–3 cm long, herbaceous, shorter than inflorescence. Inflorescence decompound, ±dense, usually 1.5–8 × 2.5 × 6 cm; main branches with anthers of 3–8-flowered clusters. Bracteoles ovate-lanceolate, 2.0–2.5 mm long, membranous-dirty white, sparsely ciliate. Tepals ±equal, glabrous, oblong-lanceolate, usually (3.0–) 3.5–4.2 mm long, dirty white (whitish-membranous with pale straw-brown base and 1–3 prominent veins). Stamens 6; anthers 1.1–1.3 mm long; filaments c. 1.0–1.1 mm long; style c. 1.0 mm long; stigmas 0.9–1.3 mm long. Capsule ±ovoid, acuminate, mucronate, pale brown; capsule segments c. 2.5 × 1.5–1.6 mm long, including mucro c. 0.5 mm long. Seeds ellipsoidal, 1.1–1.3 mm long, 0.6–0.7 mm wide; appendage c. 0.1 mm long, probably not or indistinctly fibrillate. $2n=12$, *fide* L.Borgen, *Check-List Chromos. Macarones. Vasc. Pl.* 30 (1977).

JUNCACEAE (*Luzula*)

Restricted to Canary Is., islands of Gomera and Tenerife; formerly also reported from Gran Canaria but material not seen. 21: CNY. Found in broad-leaved woodlands. Map 21.

Map: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 87 (1965).

Perennials usually 45–85 cm tall, loosely caespitose, ciliate; rhizome ascending, often with fibrous cover; stolons ascending, with base covered with brownish cataphylls. Basal leaves usually (15–) 20–30 cm long, usually 3–4 (–5) mm wide; caudine leaves 3–5, to 30 cm long, often exceeding inflorescence. All leaves acute, papillose-serrate (basal leaves often ±smooth). Lower bract herbaceous, usually up to 10–12 cm long, longer than inflorescence. Inflorescence decomound, typically 3–5 × 3–5 cm; main branches short, each with a ±dense anthelate 5–12 (–20)-flowered cluster. Bracteoles ovate to ovate-lanceolate, whitish-scarious, c. 1.5 mm long, subglabrous to sparsely ciliate. Tepals unequal (outer tepals shorter by c. 1.5 mm), glabrous, lanceolate, 4.2–5.2 (–5.5) mm long, snow-white, becoming slightly pale straw-white, or rarely suffused purplish. Stamens 6, longer than outer tepals; anthers 1.8–2.2 mm long, turning brownish after dehiscence; filaments 1.5–1.9 mm long; style 2.2–2.6 mm long; stigmas 1.0–1.3 mm long. Capsule brown, shining, acuminate and subtrigonous above, mucronate; capsule segments usually 2.0–2.4 mm long including a mucro c. 0.5 mm long and c. 1.5 mm wide. Seeds ellipsoidal, dark castaneous-brown, 1.2–1.4 mm long including a distinct apical protuberance 0.2–0.3 mm long and c. 0.7 mm wide; appendage yellowish, c. 0.1 mm long, fibrillate. 2n=12, *fide* H.Nordenskiöld, *Hereditas* 37: 328–329 (1951); Druskovic, *Int. A species with limited variation. The westernmost populations were recognized as subsp. *pyrenaica* on the basis of the inflorescence habit, broader leaves, longer tepals and smaller seeds. However, despite the fact that eastern populations show a lower frequency of broad-leaved individuals, the other characters do not exhibit any geographical tendency, and the extremes are often found within populations throughout the geographical range of the species.

Perennials usually 35–75 cm tall, loosely caespitose to caespitose, densely ciliate; rhizome horizontal to ascending, branched; stolons usually present, ascending. Basal leaves numerous, usually 12–18 (–30) cm long, width variable but ranging from (3–) 4–5 (–6) mm; caudine leaves usually 4–5, to c. 25 cm long, with the upper ones often overtopping inflorescence. All leaves with acute tip; margins papillose-serrulate. Lower bracts herbaceous, of variable length, usually overtopping inflorescence, less often shorter. Inflorescence rich, decomound, ±anethelate; main branches usually numerous, with secondary branches each bearing ±dense or lax anthela of (2–) 3–6 (–8)-flowered clusters. Bracteoles ±ovate, subglabrous to ciliate, usually 1.0–1.5 mm long. Tepals glabrous, subequal with inner longer by c. 0.5 mm, ±lanceolate, (2.0–) 2.3–3.8 (–4.2) mm long. Stamens 6; anthers 1.0–1.8 mm

long; filaments 0.3–0.6 mm long; style 0.8–1.2 mm long; stigmas 0.6–c. 1.1 mm long. Capsule oblong-ovoid, gradually acuminate, mucronate, ±castaneous-brown, ±shining; capsule segments 2.2–2.6 mm long including mucro 0.2–0.5 mm long and 1.1–1.3 mm wide. Seeds ellipsoidal, ±dark brown, usually 1.2–1.4 mm long including apical protuberance c. 0.2 mm long and 0.7–0.8 mm wide; appendage indistinct, c. 0.1 mm, fibrillate.

Europe, from the Netherlands, France and N Spain throughout C Europe to Greece, Turkey-in-Europe and W Russia. Introduced to N and E Europe and E North America, often naturalized. There are two variants, from lowland and mountain areas; the two extremes are locally linked by numerous intermediates.

Tepals ±white, dirty white or ±scarious, usually (2.0–) 2.3–3.2 mm long

9a. subsp. *luzuloides*

Tepals usually coppery-coloured, brownish-purplish or pale castaneous with reddish tinge, usually 3.0–3.5 (–4.2) mm long

9b. subsp. *rubella*

Luzula sylvatica A.I.a.b.[unranked] *pulchra* Asch. & Graebn., *Syn. Mitteleur. Fl.* 2(2): 499 (1904). T: SW Alps [otherwise not indicated].

Luzula sylvatica f. *altissima* Kožuharov, *Izv. Bot. Inst. (Sofia)* 11: 126 (1963), nom. inval.

Maps: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 87 (1965); E.Hultén & M.Fries, *Atlas N. Eur. Vasc. Pl.* 1: map 164 (1986).

Perennials, usually up to 100 cm tall, caespitose to loosely caespitose; rhizome stout, long, branched, horizontal to ascending; stolons ±absent. Basal leaves up to 40 cm long, usually 4–12 mm wide; caudine leaves 3–5 (–7); leaf tip ±acute; margins ±smooth. Lower bract (1.2–) 2.0–3.0 (–5.0) cm long, shorter than inflorescence. Inflorescence decomound, usually lax, up to 20 cm long; secondary anthers with 5–45 flowers; terminal clusters (1–) 2–3 (–5)-flowered. Bracteoles whitish-membranous, ovate, up to c. 2 mm long, sparsely ciliate. Tepals subequal; outer tepals usually 2–4 (–5) mm long, oblong-lanceolate, pale castaneous-brown to deep brown; margins usually hyaline. Stamens 6; anthers 1.0–3.7 mm long; filaments usually 0.3–0.7 mm long; style 1.6–2.2 mm long; stigmas 2.2–2.8 mm long. Capsule castaneous-brown to dark brown, ±oblong-ovoid, ±gradually narrowed, usually 2.0–4.0 mm long including mucro 0.2–0.8 mm long. Seeds brown to dark brown, oblong-ovoid, 1.2–1.9 mm long, usually 0.7–1.2 mm wide; appendage 0.1–0.2 mm, fibrillate.

Found in Europe, except for most of Scandinavia and Russia; outside Europe only marginally in the W Caucasus, Transcaucasia and N Turkey. A very variable species, particularly in the southern part of its range. Several subspecies have been described; some other aberrant populations remain to be studied, all in the S European peninsulas. Four subspecies are recognized here. In addition, some (not all) plants and populations from the Balkan peninsula, most typically from Greece, differ from the typical *L. sylvatica* in a number of characters, e.g., in having basal leaves (6–) 8–10 (–11) mm wide, inflorescence lax, few-flowered, secondary anthers usually with 8–14 (–16) flowers, terminal clusters (1–) 2–4 (–5)-flowered, tepals up to 4 (–5) mm long, capsule 3.1–3.9 mm long and seeds up to 1.2 mm wide (representative material at LD). They may represent another intraspecific taxon of *L. sylvatica*; many intermediates between these aberrants and more common forms of subsp. *sylvatica* are known from other parts of the Balkans and from Turkey. The type subspecies is often cultivated as an ornamental plant.

- 1 Tepals usually up to 2.7 mm long; primary branches of inflorescence usually elongated; secondary anthers usually ±contracted, rarely ±lax **10b.** subsp. **henriquesii**
- 1: Tepals usually more than 2.7 mm long; primary branches of inflorescence usually not distinctly elongated, ±evenly branched to form ±lax secondary anthers
- 2 Basal leaves with margins and base very densely long ciliate; tepals longer than 4 mm; secondary anthers usually with up to 15 flowers; anthers (1.7–) 2.2–2.5 (–3.0) mm long; leaf tip elongated, acuminate; seeds 1.1 mm wide or wider **10c.** subsp. **sicula**
- 2: Basal leaves with margins ciliate but not conspicuously densely or long; tepals up to 3.7 mm long; anthers up to 1.9 mm long; leaf tip acute to subobtuse-mucronate; seeds up to 0.8 mm wide

JUNCACEAE (*Luzula*)

- 3**: Plants usually 50–100 cm tall; basal leaves (7–) 9–12 mm wide; capsule usually equalling perianth **10a.** subsp. *sylvatica*

3: Plants usually up to 55 (–70) cm; basal leaves usually 5–8 mm wide; capsule equalling or shorter than perianth **10d.** subsp. *sieberi*

Capsule usually ±longer than perianth, ±ovoid, usually 1.6–2.6 mm long, mucro (0.2–) 0.4–0.7 mm long. Seeds usually 1.1–1.6 mm long, c. 0.6–0.7 mm wide; appendage c. 0.1–0.2 mm long. 2n=12, *fide* C.Garcia-Herran (see list of specimens); H.Nordenskiöld, *Hereditas* 37: 328–329 (1951).

Confined to the northern part of the Iberian Peninsula. 12: POR, SPA. Found in woodlands, particularly along rivers, on damp soils. Map 28.

12. PORTUGAL: Serra do Gerês, Albergaria, 700 m, C.Garcia-Herran 91-1134 (NEU; 2n=12); Serra da Estrela, Poço do Inferno, J.Matos, Cardoso & A.Marques 7905 (PR); Serra da Estrela: Lagoa do Covao do Curral, A.Fernandes, R.Fernandes & F.Sousa 4521 (LD); Alto Douro, Bragança, Pena de Águia, 750 m, P.Silva, B.Rainha & J.Martins 7788 (LD); Cinfaes, Fonte Nova, J.Paiva, J.Matos & A.Marques 8481 (PR). SPAIN: Asturias, Grado, San Pelayo, 2 May 1978, J.J.Lastrilla (FCO 24033); Asturias Luarca, along Esva R., near Pontigón, 24 Mar 1974, T.E.Díaz (FCO 23640); Salamanca, Miranda del Castañar, 690 m, 4 Apr 1985, D.Sánchez-Mata & V. de la Fuente (FCO 17362).

A variable subspecies with several local variants. The eastern populations approach the type subspecies.

10c. *Luzula sylvatica* subsp. *sicula* (Parl.) K.Richt., *Pl. Eur.* 1: 183 (1890)

Luzula sicula Parl., *Nuov. Gen. Sp. Monocot.* 59 (1854); *Luzula maxima* subsp. *sicula* (Parl.) Nym., *Consp. Fl. Eur.* 751 (1882); *Luzula sieberi* subsp. *sicula* (Parl.) Pignatti, *Fl. Ital.* 3: 444 (1982), *nom. inval.* T: Sicily: ‘monti di Sicilia nelle Madonie, in Montesoro, nei boschi di Caronia, di Mistretta, di Cannata, di Francavilla’; syn: *n.v.*

Plants usually 30–45 (–65) cm tall. Basal leaves usually 3–4 (–6) mm wide, with elongated acuminate tip; margins and base very densely ciliate. Inflorescence lax, few-flowered; secondary anthers usually with (5–) 8–13 (–16) flowers; terminal clusters (1–) 2–3 (–4)-flowered. Outer tepals usually 4.3–4.8 (–5.2) mm long. Anthers (1.7–) 2.2–2.5 (–3.0) mm long; filaments 0.2–0.6 mm long; style 1.7–1.9 mm long; stigmas on average 2.4–2.6 mm long. Capsule usually ±equaling perianth or shorter, ±ovoid, 3.5–4.1 (–4.4) mm long; mucro (0.2–) 0.4–0.8 mm long. Seeds (1.5–) 1.7–2.0 (–2.2) mm long, 1.1–1.3 mm wide; appendage c. 0.2 mm long. 2n=12, *fide* C.Garcia-Herran (see list of specimens).

Southernmost Italy and Sicily. 13: ITA, SIC. In mountains, on volcanic slopes with sparse vegetation or broad-leaved (mostly *Fagus sylvatica*) woodlands. Map 29.

Austr.] 104, ut *Juncus maximus* β *angustifolius*; lecto: PRC, designated here; isolecto: BRNM.

Illustration: S.Pignatti, *Fl. Ital.* 3: 444 (1982).

Plants usually up to 55 (–70) cm tall. Basal leaves usually 4–8 (–9) mm wide; apex subobtuse, sharply mucronate; margins ciliate. Inflorescence lax, ±few-flowered; secondary anthers usually with 15–20 flowers; terminal clusters 1–3-flowered. Outer tepals usually 2.7–3.9 mm long. Anthers usually 1.7–1.9 (–2.3) mm long; filaments 0.2–0.5 mm long; style c. 1.9–2.2 mm long; stigmas 2.2–2.6 mm long. Capsule usually ±equalling or shorter than perianth, oblong-ovoid, usually (2.3–) 2.8–3.0 (–3.3) mm long; mucro (0.2–) 0.7–0.8 mm long. Seeds 1.2–1.9 mm long, c. 0.7 mm wide; appendage c. 0.2 mm long. 2n=12, *fide* Druskovic, *Int. Organ. Pl. Biosyst. Newslett.* 24: 14 (1995).

South-Central Europe, most frequently in the Alps and N Italy. 11: AUT, GER, SWI. 12: FRA, SPA. 13: ITA, YUC. Found in mountain coniferous woodlands, in tall-grass vegetation near timberline. Map 30.

11. AUSTRIA: Karnische Alpen, Kleiner Pal, c. 1800 m, *L.Kirschnerová* 4-989 (PRA); Tyrol, Luttach, Schönberg, 1 Jul 1896, *Treffer* (PR); Tyrol, Brenner, 1500–1600 m, *R.Huter* (PR, WU). SWITZERLAND: Graubünden, Versam, Maiensäss Fahn, 1200 m, *L.Meisser* [*J.Braun-Blanquet, Fl. Raet. Exs.*] 421 (PR). 13. ITALY: Etruria, Grosseto, Mt Amiata, 800–1200 m, *A.Fiori & A.Béguinot* [*Fl. Ital. Exs.*] 2629 (WU).

Occasional intermediates exist in regions of contact with subsp. *sylvatica* and in marginal parts of the range, (for instance in the E Pyrenees).

Presumed Hybrids

Luzula ×hermannii-muelleri Asch. & Graebn., *Syn. Mitteleur. Fl.* 2(2): 507 (1904) = *Luzula luzuloides* (Lam.) Dandy & E.Willm. × *L. sylvatica* (Huds.) Gaudin

T: [Germany] Westfalen, Arnsberger Wald südlich von Drüggelte, *H.Mueller*; syn: n.v.

A rather doubtful hybrid requiring further study.

Luzula ×favratii K.Richt., *Pl. Eur.* 1: 185 (1890) = *Luzula luzuloides* (Lam.) Dandy & E.Willm × *L. nivea* (Nathh.) DC.

T: [Switzerland] Bois de Sauvabelin, Lausanne, *L.Favrat*; syn: W.

Luzula × schultzorum Dalla Torre & Sarnth., *Farn- u. Blütenfl. Tirol.* 1: 434 (1906). T: [Austria] 'B, Ratzes'; syn: n.v.

A rare hybrid ±intermediate between the parents; known from Austria and Switzerland. It requires further study.

Luzula ×levieri Asch. & Graebn., *Syn. Mitteleur. Fl.* 2(2): 509 (1904) = *L. nivea* (Nathh.) DC. × *Luzula pedemontana* Boiss. & Reut.

T: [Italy] in den Etrurischen Apenninen, im Walde Della Fornace bei Boscolungo, *E.Levier*; syn: n.v.

A rather doubtful hybrid requiring a field investigation.

Luzula ×lepetitiana Beyer, *Verh. Bot. Vereins Prov. Brandenburg* 41: xiv (1900) = *Luzula pedemontana* Boiss. & Reut. × *L. sylvatica* (Huds.) Gaudin

T: [N Italy] Borgone, Sangone, am nordöstlichen Abhange des Mte. Salancia, *R.Beyer*; holo: n.v.

Luzula ×hasleri Murr, *Magyar Bot. Lapok* 28: 68 (1930) = *Luzula alpinopilosa* (Chaix) Breistr. × *L. sylvatica* subsp. *sieberi* (Tausch) K.Richt.

T: Liechtenstein, Heupiel (Heubühl), 1867 m, 2 Aug 1921, *J.Murr*; syn: n.v.

Material not seen. The existence of the hybrid is rather doubtful.

JUNCACEAE (*Luzula*)

Luzula ×johannis-principis Murr, *Liechtenst. Volksblatt*, 1921, no 49 [21 Jun 1921] = *Luzula sylvatica* subsp. *sieberi* (Tausch) K.Richt. × *L. alpina* Hoppe

T: Liechtenstein, Rojaberg, 1630 m, *J.Murr*; syn: K, S, W.

Numerous specimens from the type locality represent ±sterile plants, partly referable to *L. multiflora*, partly of an appearance intermediate between the presumed parents. Further study is needed.

Luzula ×pfaffii Murr, *Allg. Bot. Z. Syst.* 1910: 118 (1910) = *Luzula lutea* (All.) DC. × *L. luzuloides* subsp. *rubella* (Mert. & W.D.J.Koch) Holub

T: [Italy] Bozen, Ritterhorn, 2260 m, 4 Sep 1909, *W.Pfaff*; syn: n.v.

A rather doubtful hybrid; further study is needed.

Luzula ×bornmuelleriana Kük., *Mitth. Thüring. Bot. Vereins* 23: 90 (1908) = *Luzula alpinopilosa* × *L. lutea*

T: [Austria] Tirol, Pitztal, Mittelberg, Taschachbach, 2000 m, *G.Kükenthal*; syn: n.v.

Another very improbable hybrid, *Luzula pilosa* (L.) Willd. × *L. sylvatica* (Huds.) Gaudin, has been reported under an invalid name, *L. × buchenaui* P.Fourn., *Quatre Fl. France* 154 (1935).

Sect. 2. ATLANTICAE

Luzula sect. **Atlanticae** Kirschner, *Taxon* 50: 1107 (2001)

T: *Luzula atlantica* Braun.-Blanq.

Perennials with short ascending rhizomes. Leaf tip acute. Lower bract subherbaceous, usually ±membranous, shorter than inflorescence. Inflorescence racemose, decompound, with 3–8 thin primary branches; secondary branches rare; flower heads subglobose, (1–) 2–7-flowered. Tepals membranous, mucronate, with a castaneous midrib. Style very short. Seeds sub-globular, smooth; appendage indistinct. 2n=12.

A monotypic section restricted to the mountains of Morocco.

11. *Luzula atlantica* Braun-Blanq., *Vierteljahrsschr. Naturf. Ges. Zürich* 73, Suppl. 15: 347 (1928)

T: Morocco, Great Atlas, Zerekten, 1500–2000 m, *J.Braun-Blanquet*; holo: MPU, n.v. [In the Braun-Blanquet herbarium, MPU, no specimen with the above locality was located. The plant photographed in the protologue, deposited in MPU and labeled 'Gourdouze, 2000 m' thus may be a good candidate for a lectotype.]

Illustrations: J.Braun-Blanquet, *Vierteljahrsschr. Naturf. Ges. Zürich* 73, Suppl. 15: fig. 7, 356 (1928); R.Maire & Weiller, *Fl. Afr. Nord* 4: 308, fig. 729 (1957).

Map: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 87 (1965).

Perennials 10–30 (–35) cm tall, caespitose, ciliate; rhizome short, vertical to oblique, sometimes many-headed; stolons absent. Basal leaves usually 4–10 (–14) cm long, 2–4 (–5) mm wide; caudine leaves 1 (–2), usually 2–5 cm long. All leaves with long acuminate tip; margins papillose-serrulate. Lower bract ±herbaceous, sometimes ±membranous, shorter than inflorescence. Inflorescence decompound; main branches 3–8, smooth or sparsely papillose below clusters, thin, c. 0.2 mm in diam., often flexuose, patent to erect; secondary branches rare, with each branch bearing loose terminal (1–) 2–7-flowered glomeruliform clusters 4–5 mm in diam. Bracteoles ovate-lanceolate, subaristate, glabrous to sparsely ciliate, 1.5–2.0 mm long, membranous-scariosus; midrib often castaneous-brown. Tepals ±equal, glabrous, entire or the inner ones minutely denticulate below apex, lanceolate to ovate-lanceolate, often almost entirely membranous with dark castaneous-brown midrib and short mucro, sometimes castaneous-brown with broad membranous margins, 1.9–2.6 mm long. Stamens 6; anthers c. 0.4 mm long, much shorter than filaments; filaments 0.8–0.9 mm long; style c. 0.2 mm

long; stigmas 1.0–1.2 mm long. Capsule subglobular, ±obtuse, mucronate, castaneous-brown; capsule segments 1.7–2.0 mm long, including mucro 0.1–0.2 mm long and 1.4–1.5 mm wide. Seeds subglobular, pale castaneous-brown, smooth, shining, 0.8–0.9 (–1.0) mm long, 0.7–0.8 mm wide; apex pale; basal appendage indistinct, to 0.1 mm long, very sparsely fibrillate. $2n=12$, *fide* N.Galland, *Trav. Inst. Sci. Univ. Mohammed V, Sér. Bot.*, 35 (22): 106–121 (1988).

Endemic to the Great Atlas and Anti-Atlas in Morocco. 20: MOR. Amongst shady mountain rocks in open oak woodlands. Map 31.

20. MOROCCO: Great Atlas, Oukaimeden, 2500–2600 m, P.H.Davis 67595 (E); Reraya, Sidi-Chamarouch, 2350–2500 m, 1923, R.V.Litardière (MPU); Great Atlas, Reraya Valley, Sidi-Chamarouch, 2400–2500 m, 21 Jul 1924, R.Maire (P); Great Atlas, Gourdouze, 1800 m, Apr 1928, J.Braun-Blanquet & I.Braun-Blanquet (MPU).

A species in many respects intermediate between sections *Anthelaea* and *Diprophylloseae*. The seed characters clearly point to *Luzula (Marlenia) elegans* Lowe.

Sect. 3. NODULOSAE

***Luzula* sect. *Nodulosae* Chrtek & Křísa, *Preslia* 46: 211 (1974)**

Luzula subsect. *Nodulosae* (Chrtek & Křísa) Novikov, *Byull. Moskovsk. Obshch. Isp. Prir., Otd. Biol.* 95(6): 66 (1990). T: *Luzula nodulosa* E.Mey.

Perennials with thick nodulose horizontal rhizomes. Leaf tips acuminate, subulate. Lower bract ±membranous to subherbaceous. Inflorescence umbelloid or anthelate, composed of capituliform dense large clusters, on ±suberect peduncles. Seeds broadly ovoid, large, 1.7–1.9 × 1.3–1.4 mm, with apical and basal patches of looser outer seed-coat; appendages absent; base distinctly fibrillate.

A monotypic section confined to the Mediterranean region, disjunctly in NW Africa and from Greece to W Anatolia.

Luzula nodulosa var. *mauretanica* R.Maire & Trab., in R.C.J.E.Maire, *Bull. Soc. Hist. Nat. Afrique N.* 22: 319 (1931). T: Algeria, Monts Tlemcen, entre Terni & Sebdou, L.Trabut; holo: P.

Illustration: F.G.P.Buchenau, in H.G.A.Engler, *Pflanzenr.* (iv.36) 25: 65, fig. 46a, 66, fig. 46b (1906).

Perennials c. (15–) 30–55 (–70) cm tall, loosely caespitose or one-stemmed; rhizome thick, c. 3–5 mm in diam., creeping to ascending, often with fibrous cover, nodulose, with internodes usually 0.5–2.0 cm long, stolons short, ascending. Lowermost leaves cataphyllous, c. 1–3 cm long, brownish; basal leaves flat, 7–16 (–20) cm long, 3.5–5.0 (–7.5) mm wide; caudine leaves 3–4 (–5), (1.5–) 2.5–5.0 (–15) cm long; margins densely ciliate, later sometimes glabrescent, densely papillose-serrulate; apex subulate. Lower bract brownish-membranous to subherbaceous, c. 1.0–3.5 (–5.0) cm long, shorter than inflorescence. Inflorescence of (1–) 2–5 (–15) large hemispherical to cup-shaped clusters; clusters (2–) 3–5 (–11)-flowered, 0.7–1.0 cm long, c. 1.0–1.5 cm wide; peduncles suberect, c. 2–10 cm long, smooth; secondary branches absent or frequent, distally inserted, short. Bracteoles scarious, often brownish at base, ovate, acuminate, c. 3.0–3.5 mm long; midrib distinct. Tepals ±equal, ovate-lanceolate or broadly lanceolate, c. 5.0–6.5 mm long, acute to acuminate; central band deep castaneous-brown; margins distinct, broad, membranous. Stamens 6; anthers 1.7–3.5 mm long, 2–10 times as long as filaments; filaments 0.3–0.9 mm long; style 1.8–2.7 mm long; stigmas c. 2.5–4.0 mm long. Capsule ovoid to broadly ovoid, acuminate, shorter than perianth, dark castaneous to pale castaneous-brown; capsule segments 3.3–4.0 × 2.3–2.8 mm

JUNCACEAE (*Luzula*)

long; mucro to 0.5 mm long. Seeds broadly ovoid, deep brown, 1.7–1.9 mm long, 1.3–1.4 mm wide, with apical and basal whitish patches of loose outer seed-coat, distinctly fibrillate.

Disjunctly in two areas: the E Mediterranean (from Greece to W Anatolia) and NW Africa (Algeria and Morocco). 13: GRC, KRI. 20: ALG, MOR. 34: EAI, TUR. Rocky slopes, open woodlands. Map 32.

13. GREECE: Attica, 650–1300 m, *T.H.Heldreich* [Herb. *Graecum Norm.*] 148 (P); Attica, Mt Pentelica, *T.G.Orphanides* 1105 (WU). KRITI: Askyplicus, 1846, *T.H.Heldreich* (W); Hag. MOROCCO: Bab-Bou-Idir, *C.G. van Steenis* 19181 (L). 34. EAST AEGEAN IS.: Samos, Mt Ambelos, 800 m, *K.H.Rechinger* & *F.Rechinger* 3905 (K). TURKEY: Çanakkale, Erenköy, Renkoei Scala, 16 Apr 1883, *P.E.E.Sintenis* [It. *Trojan.J.*] 297 (W, UPS).

Variable in stamen and pistil characters. There are two main forms, one with anthers 1.7–2.5 mm long, about 2–3 times as long as filaments, and style c. 2 mm long, the other with anthers 2.0–3.5 mm long, usually 4–8 times as long as filaments, and style c. 2.2–2.7 mm long. In N Africa, and in Morocco in particular, plants with longer anthers and styles predominate, mostly on limestone. Many African plants, however, are indistinguishable from the E Mediterranean ones, and intermediates are not rare.

Sect. 4. DIPROPHYLLATAE

Luzula* sect. *Diprophyllatae Satake, in T.Nakai & M.Honda, *Nov. Fl. Jap.* 1: 25 (1938)

Perennials, subglabrous to sparsely ciliate; rhizome branched, ascending. Leaves with acute tips. Lower bract herbaceous to subherbaceous. Inflorescence decomound, a ±nodding to suberect panicle. Flowers usually borne singly, some in 2–5-flowered clusters. Tepals usually 2.0–2.5 (–3.5) mm long. Seeds usually ellipsoid to oblong-ellipsoid; appendage absent or, when visible, basal, fibrillate.

A section with 12 species of mostly subarctic and oro-boreal, or alpine distribution. Main centres of diversity are in W North America and Europe; two species reach the southern hemisphere. Almost exclusively, diploids ($2n=12$ AL) and agmatoploids with $2n=24$ BL are known in the section. The species are very close to one another in their general habit.

- 1 Upper part of capsule and mucro densely papillose; inflorescence usually storied (inflorescence subdivided in several subequal panicles separated by long rhachis segments; inflorescence usually constitutes $\frac{1}{3}$ of plant height or more)
 - 1: Capsule smooth; inflorescence storied or not so
 - 2 Inflorescence storied
 - 13. *L. gigantea*
 - 2: Inflorescence not storied
 - 3 Panicle branches abbreviated, and inflorescence therefore subcongested
 - 16. *L. subcapitata*
 - 3: Panicle branches (at least the main ones) long; panicle loose or subdense, never subcongested

- 4 Tepals stramineous to pale brownish, with apex often ±reflexed; inflorescence very lax, with rigidly divaricate branches **17. *L. divaricata***
- 4: Tepals blackish brown to dark castaneous-brown, with apex not reflexed; inflorescence lax to subdense, ±nodding to suberect, with branches not rigidly divaricate
- 5 Basal leaves densely to sparsely ciliate. [Mexico to Panama] **14. *L. denticulata***
- 5: Basal leaves subglabrous. [Outside C America]
- 6 Capsule segments usually 3.0–3.5 × 1.8–2.0 mm **19. *L. hitchcockii***
- 6: Capsule segments to 2.9 mm long and to 1.6 mm wide
- 7 Anthers ±equalling filaments or shorter; style up to 0.5 mm long
- 8 Plants usually more than 30 cm tall; caudine leaves (3–) 4–5, usually 5–10 mm wide **22. *L. parviflora***
- 8: Plants usually up to 30 cm tall; caudine leaves 1–3, usually less than 5 mm wide
- 9 Cauline leaves bluish green to greyish green, (2–) 3; lower bract 1.5–2.5 cm long **18. *L. piperi***
- 9: Cauline leaves mid-green, 1–2; lower bract to 1 cm long
- 7: Anthers (2–) 3–5 (–9) times longer than filaments; style usually longer than 0.5 mm
- 10 Capsule segments to 2.4 mm long; seeds stramineous to pale brown **24. *L. alpinopilosa***
- 10: Capsule segments 2.4–3.0 mm long; seeds brown to dark brown
- 11 Cauline leaves 10–20 cm long, usually 3–6 mm wide; anthers usually 3–4 times longer than filaments **21. *L. desvauxii***
- 11: Cauline leaves up to 6 cm long, usually 4.5–8.0 mm wide; anthers usually 5–7 times longer than filaments **20. *L. glabrata***

Map: H.Balslev, *Fl. Neotrop. Monogr.* 68: 54, fig. 27 (1996).

Perennials 20–90 cm tall; rhizome ascending, 1.5–3.0 mm in diam.; stolons long, ascending. Basal leaves 10–30 cm long, (5–) 10–20 mm wide, flat; margin densely papillose-serrulate, ciliate in young leaves; caudine leaves usually 2–4, with upper ones usually up to 10–13 mm wide; sheaths to 6 cm long; leaf tip acute. Inflorescence a rich loose compound panicle constituting more than one third of plant height, storied and subdivided by 5–15 cm long rhachis segments into 4–5 subequal nodding anthers parts; flowers borne singly (rarely in clusters of 2–3). Bracts of primary inflorescence branches resembling caudine leaves, with proximal ones to 20 cm long and distal ones gradually shorter; bracts on distal branches brownish-membranous, linear-lanceolate, c. 1.0–1.5 cm long. Bracteoles ovate to ovate-lanceolate, brownish-membranous, 1.6–2.0 mm long, usually entire, glabrous or sparsely ciliate, inserted 0.2–0.5 mm below flowers. Tepals ±unequal, glabrous, acuminate, usually dark castaneous brown, margins paler; outer tepals usually 2.2–2.7 mm long; inner tepals usually 2.0–2.5 mm long. Stamens 6, 1.0–1.5 mm long; anthers 0.3–0.6 mm long; filaments 0.7–0.9 mm long; style 0.2–0.3 mm long; stigmas ±patent, 0.6–0.8 mm long. Capsule broadly ellipsoidal, apiculate, shorter than perianth, castaneous, shining; capsule segments often slightly

JUNCACEAE (*Luzula*)

mucronate, 1.6–1.9 × c. 1.1 mm long. Seeds ± ellipsoidal, (0.9–) 1.0–1.1 × 0.5–0.6 mm; outer seed-coat white to light brown; appendage almost not visible, c. 0.1 mm long; base fibrillate. Fig. 9.

South America, in the Andes from Venezuela and Colombia to Bolivia and N Argentina. 82: VEN. 83: BOL, CLM, ECU, PER. 85: AGW. Open mountain slopes, páramo, along streams, usually between 3000 and 4000 m. Map 33.

82. VENEZUELA: Mérida, Trujillo, *J.Linden* 412 (BM, BR, G, P, US). 83. BOLIVIA: Cochabamba, Chapare road at km 110, 3000 m, *R.F.Steinbach* 611 (LPB, NY, S, US, WIS); La Paz, Larecaja, near Sorata and Mt Sanquiarie, 3200 m, *G.Mandon* 1423 (BM, K, NY, P, S, US). Map: H.Balslev, *Fl. Neotrop. Monogr.* 68: 54, fig. 27 (1996).

Perennials 15–80 cm tall; rhizome ascending, long, often with long ascending stolons. Basal leaves 5–25 cm long, 8–12 mm wide; caudine leaves usually 3–5 (–8), usually 6–8 cm long, 4–5 mm wide. All leaves usually densely ciliate, less often subglabrous, acute, with ± papillose-serrulate margins. Lower bract herbaceous, up to 6 cm long; next upper bract linear, brownish membranous, ciliate, c. 1 cm long. Inflorescence terminal, a loose nodding anethelately arranged panicle 5–20 × 3–10 cm; flowers borne singly. Bracteoles brownish-membranous, ± ovate, acute, 1.2–1.6 mm long, ciliate, inserted c. 0.1–0.2 mm below flower. Tepals subequal, glabrous, narrowly-lanceolate, acuminate, pale to dark brown, 1.7–2.4 mm long. Stamens 6; anthers 0.4–0.7 mm long, equalling or longer than filaments; filaments 0.3–0.5 mm long; style 0.1–0.2 mm long; stigmas 0.8–1.0 mm long. Capsule dark brown, shining, ovoid, acute, often equalling or exceeding perianth; capsule segments 1.5–1.7 × 1.0–1.3 mm. Seeds oblong-ellipsoidal, brown, 1.0–1.1 mm long, 0.6–0.7 mm wide; appendage indistinct, to c. 0.1 mm, fibrillate. Fig. 10.

Juncoides subcapitata Rydb., *Bull. Torrey Bot. Club* 1904: 401 (1904). T: USA, Colorado, Silver Plume, 1895, *C.L.Shear* 4611; holo: NY.

Illustration: J.Coffey Swab, *Fl. North Amer.* 22: 262 (2000).

Map: J.Coffey Swab, *Fl. North Amer.* 22: 261 (2000).

Perennials 15–30 cm tall, loosely caespitose; rhizome ascending, with numerous short ascending vegetative shoots. Stem ±green. Basal leaves 1–4, 3.5–6.0 cm long, 4–5 mm wide; cauline leaves 3 (–4), with lower ones broader, 3–6 cm long, 2.0–5.5 mm wide. All leaves

JUNCACEAE (*Luzula*)

apiculate, glabrous or with sparse hairs at sheath mouth. Lower bract up to 1.5 cm long, rarely 3 cm long, sometimes overtopping inflorescence. Inflorescence a single congested dark head composed of indistinct clusters; each flower usually with a short visible peduncle to 1 mm. Bracteoles 1.0 (–1.5) mm long, brown; apex obtuse, ciliate. Tepals equal, glabrous, ovate-lanceolate, 1.8–2.2 mm long, ±dark castaneous-brown; margins not visible. Stamens 6; anthers (0.3–) 0.4 mm long, slightly shorter than or equal to filaments; filaments c. 0.4 mm long; style 0.2–0.3 mm long; stigmas 0.8–1.0 mm long. Capsule subglobular-ovoid, equalling or slightly exceeding perianth, almost rounded above, with a short apiculate mucro; capsule segments 1.7–1.8 × 1.2–1.3 mm long. Seeds paler castaneous-brown, c. 1.0 mm long, c. 0.6 mm wide; appendage absent; base fibrillate.

A restricted endemic of mountains in Colorado, USA. 73: COL. Damp, boggy areas near alpine lakes and streams, usually above 3000 m. Map 36.

73. USA, COLORADO: San Juan Co., Tenmile Basin, Animas R. drainage, SE of Silverton, Needle Mtn Quadrangle, J.Michener 789 (S); Willow Lake, W.W.Robbins 7933 (H).

Luzula subcapitata occupies an isolated position in the section; it is the only species with abbreviated inflorescence branches and peduncles, i.e., with a ±congested inflorescence.

Perennials, usually 15–30 cm tall, loosely caespitose, subglabrous to ±glabrous; rhizome creeping to ascending; stolons usually ascending. Leaves of sterile shoots usually 10–15 cm long, (4–) 5–7 (–10) mm wide; leaves at stem base usually short, 2–5 cm long; caudine leaves 3–4, usually 3.5–6.0 cm long, 4.5–8.0 mm wide. All leaves with papillose-serrulate margins; apex acute. Lower bract ±herbaceous, to 2–3 cm long, much shorter than inflorescence. Inflorescence ±loose, ±nodding to suberect, ±divaricate, usually 5–9 × 3–6 cm, usually more than 35–50-flowered; flowers usually borne singly. Bracteoles ±ovate, membranous, often suffused brownish, c. 1.5–2.0 mm long, ciliate. Tepals equal, glabrous, ±lanceolate, acuminate, 2.4–3.0 mm long, deep to dark castaneous-brown, with margins indistinct or narrow, paler brownish. Stamens 6; anthers (1.1–) 1.4–1.6 (–2.1) mm long, up to 10 times as long as filaments; filaments 0.2–0.3 mm long; style 0.5–0.9 mm long; stigmas 1.0–1.5 mm long. Capsule ±ovoid, acute, shortly rostrate, dark brown, usually slightly exceeding perianth; capsule segments 2.5–2.9 × c. 1.4–1.6 mm. Seeds ±oblong-ovoid, c. 1.2–1.4 mm long, c. 0.7 mm wide; appendage indistinct; base fibrillate. 2n=12 [AL], *fide* H.Nordenskiöld, *Hereditas* 37: 330–331 (1951).

21. *Luzula desvauxii* Kunth, *Enum. Pl.* 3: 304 (1841)

Luzula spadicea var. *desvauxii* (Kunth) E.Mey., *Linnaea* 22: 400 (1849); *Luzula glabrata* var. *desvauxii* (Kunth) Buchenau, *Krit. Verz. Juncac.* 83 (1879); *Luzula glabrata* subsp. *desvauxii* (Kunth) K.Richt., *Pl. Eur.* 1: 185 (1890); *Luzula glabrata* proles *desvauxii* (Kunth) P.Fourn., *Quatre Fl. France* 153 (1935). T: France, Auvergne, Mont Dore, *Maire*; holo: B, destroyed.

Perennials usually (25–) 35–40 (–65) cm tall, loosely caespitose, subglabrous; rhizome creeping, branched; stolons short, ascending. Leaves of sterile shoots usually 15–20 cm long, 3–6 mm wide; basal leaves few, intermediate between cataphylls and caudine ones; caudine leaves 3–5, usually 10–20 cm long, 3.0–5.5 (–7.5) mm wide, conspicuously overlapping, with upper ones sometimes exceeding inflorescence. All leaves almost glabrous, with

JUNCACEAE (*Luzula*)

papillose-serrulate margins; apex acute. Lower bract herbaceous, usually 2.5–5 cm long, shorter than or almost equaling inflorescence. Inflorescence many-flowered, ±nodding, later suberect, usually 5–7 × 4–5 cm; flowers borne singly or crowded in 2 (3–4)-flowered groups. Bracteoles scarious, ovate, ciliate, c. 1.5 mm long. Tepals equal, glabrous, lanceolate, acuminate, usually 2.4–2.8 mm long, deep to dark castaneous-brown; margins inconspicuous, paler (straw-) brown. Stamens 6; anthers (1.0–) 1.1–1.4 (–1.7) mm long; filaments 0.3–0.5 mm long; style c. 0.8–1.0 mm long; stigmas 1.0–1.5 mm long. Capsule oblong-ovoid, ±acute, shortly mucronate, dark brown, shining, ±equaling, or slightly longer than perianth; capsule segments (2.4–) 2.5–2.8 (–3.0) × c. 1.3–1.5 mm. Seeds ±ovoid, 1.1–1.3 mm long, c. 0.8 mm wide, brown; appendage to 0.1 mm long, fibrillate. 2n=12 [AL], *fide* A.-M.Lambert & J.Giesi, *Inform. Annuelles Caryosyst. Cytopogén.* 1: 28 (1967).

SW Europe, disjunctly in the E Pyrenees, Massif Central, Vosges and S Schwarzwald. Reported from Montes Cantábricos, N Spain, but material not seen [see P.Montserrat, *Anales Inst. Bot. Luzula parviflora var. *sparsiflora* Lange, *Consp. Fl. Groenland.* 125 (1880). T: [not indicated; numerous syntypes from Greenland].

Map: E.Hultén & M.Fries, *Atlas N. Eur. Vasc. Pl.* 1: map 166 (1986).

Perennials 30–90 cm tall, loosely caespitose; rhizome ascending; stolons short, ascending, less often absent. Basal leaves 10–20 cm long, usually 5–10 mm wide; caudine leaves (3–) 4–5, 3–10 mm wide. All leaves with papillose-serrulate margins; apex acute. Lower bract herbaceous or brownish membranous, usually 1.5–4.0 cm long, shorter than inflorescence. Inflorescence usually lax, sometimes nodding, with some main branches to 13 cm long, often arcuate; flowers borne singly. Bracteoles subglabrous to sparsely ciliate, ovate, membranous. Tepals equal, glabrous, ±lanceolate, 1.8–2.3 (–2.5) mm long. Stamens 6; anthers 0.3–0.6 mm long, as long as or shorter than filaments. Capsule smooth above. Seeds ±ellipsoid, brown to dark brown, 1.0–1.4 mm long; base fibrillate.

A widely distributed northern circumpolar species, most common in subarctic areas and in the mountains of N Europe, N Asia and temperate North America. Three subspecies are recognized.

- 1 Inflorescence many-flowered with long main branches and short most distal secondary branches (peduncles); perianth segments medium brown **22a. subsp. *parviflora***
- 1: Inflorescence few-flowered, with long main branches and long distal secondary branches (almost divaricate); perianth segments usually pale brown to stramineous
- 2 Stem conspicuously reddish at base; caudine leaves mid-green, shining, tepals with a distinct midrib **22b. subsp. *fastigiata***
- 2: Stem without reddish coloration or with indistinct reddish tinge at base; caudine leaves bluish or greyish green, dull, tepals with an indistinct midrib **22c. subsp. *melanocarpa***

22a. *Luzula parviflora* (Ehrh.) Desv. subsp. *parviflora*

Luzula neglecta Kunth, *Enum. Pl.* 3: 301 (1841); *Luzula spadicea* f. *parviflora* (Ehrh.) I.Grint., *Fl. Rep. Soc. Roman.* 11: 594 (1966). T: Norway, Dovrefjeld, Vollasoe, 1828, [*anonymous*]; syn: herb. Buek, n.v.; syn: 'in herb. Lucaeno', n.v.; iso: PR.

Map: N.K.Kovtonyuk, in L.I.Malyshev & G.A.Peshkova, *Fl. Sibiri* 4 (*Araceae – Orchidaceae*): map 38 (1987) [Siberia].

Plants usually (30–) 40–60 cm tall, slightly reddish at base. Basal leaves 12–17 cm long, 5–8 mm wide; caudine leaves (3) 4–5, lanceolate, acuminate, up to 7–9 cm long, 3–8 mm wide, often shorter than internodes. Inflorescence many-flowered; main branches to 9 (–10) cm long, nodding to suberect; distal secondary branches short (partial inflorescences not distinctly loose). Bracteoles entire and glabrous to sparsely ciliate. Tepals acute, not rigid; midrib not distinct, usually 1.9–2.3 (–2.5) mm long. Anthers 0.4–0.5 mm long, filaments c. 0.5 mm long; style 0.2–0.3 mm long; stigmas c. 0.5–0.7 mm long. Capsule oblong-ellipsoid, acute to acuminate-trigonous; mucro c. 0.2 mm long, dark brown; capsule segments 1.9–2.3 × 1.0–1.3 mm. Seeds mid-brown, 1.1–1.3 mm long, 0.6–0.7 mm wide; appendage indistinct, to 0.1 mm; base strongly fibrillate. 2n=24 [BL], *fide* H.Nordenskiöld, *Hereditas* 37: 330–331 (1951); *fide* T.Engelskjøn, *Opera Bot.* 52: 14 (1979); 2n=22 [2AL+20BL], *fide* L.Hämet-Ahti & Virrankoski, *Ann. Bot. Fenn.* 8: 158 (1971). Fig. 11.

23. *Luzula effusa* Buchenau, *Krit. Verz. Juncac.* 88 (1879)

Juncoides spadicea Kuntze var. *effusa* (Buchenau) Kuntze, *Revis. Gen. Pl.* 2: 724 (1891). T: Sikkim, alt. 10000 ped. [c. 3000 m], J.D.Hooker 3; syn: K.

Perennials (20–) 40–80 (–100) cm tall, loosely caespitose, subglabrous; rhizome creeping or ascending, branched; stolons usually present, short or to c. 10 cm long. Leaves with densely papillose-serrulate margins; apex acute; basal leaves few; cauline leaves 3–6 (upper 2 or 3 represent leaf-like bracts). Inflorescence usually lax, usually constituting $\frac{1}{3}$ – $\frac{1}{2}$ of plant height, decompound, storied; partial inflorescences subtended by leaf-like bracts; branches diverging at wide angles; flowers borne singly, rarely in 2 (–3)-flowered clusters. Tepals equal, glabrous, ±lanceolate, usually 1.8–2.8 mm long, pale reddish brown to dark castaneous-brown. Stamens 6; anthers 0.5–1.1 mm long; filaments 0.6–1.0 mm long; style usually 0.4–0.5 mm long; stigmas 1.0–1.5 mm long. Capsule ovoid to ±ellipsoid, subacute to acute, with mucro 0.2–0.4 mm long, distinctly papillose above when ripe, equaling or ±longer than perianth; capsule segments c. 2.1–2.3 × 1.1–1.4 mm. Seeds deep brown, 1.2–1.4 mm long, (0.6–) 0.7–0.8 mm wide; apex usually distinct; basal appendage indistinct, to 0.1 mm, fibrillate.

A widely distributed variable complex of populations extending from E Nepal to SW China, Taiwan and S Malesia. The variation is centred in Sichuan and adjacent territories where two varieties linked by occasional intermediates are recognized. The whole group is in need of revision. Most common habitats include humid mountain forests, wet scrub, shady ravines and cliff-faces.

Lower cauline leaves usually 4–11 mm wide; tepals ±brown to deep (castaneous-)brown; stem usually less than 1.5–2.0 mm in diam.

23a. var. effusa

Lower cauline leaves usually 10–21 mm wide; tepals paler reddish brown to brown; stem usually 3–6 mm in diam.

23b. var. chinensis

23a. *Luzula effusa* Buchenau var. *effusa*

Illustrations: Muh-Tsuen Kao & C.E.Devol, in Hui-Lin Li, *Fl. Taiwan* 5: 155, plate 1304 (1978); H.J.Noltie, *Fl. Bhutan* 3(1): 263, fig. 25 (1994); K.F.Wu, *Fl. Reipubl. Popularis Sin.* 13(3): 240, plate 58 (1997).

Plants usually to (50–) 80 cm tall, often slender; stolons short to long. Stem usually 1–2 mm diam. Cauline leaves usually 4–11 mm wide. Tepals ±brown to deep (castaneous-)brown, usually 1.8–2.8 mm long. Anthers 0.5–1.1 mm long; filaments usually 0.6–0.8 (–1.0) mm long.

The East Himalaya from E Nepal to Manipur, N Burma, SW and C China, Taiwan, Luzon, Borneo, Sulawesi and New Guinea. 36: CHC, CHN, CHT. 38: TAI. 40: EHM, NEP. 41: BMA. 42: BOR, NWG, PHI, SUL. Humid mountain woodlands, shrubby slopes and subalpine ravines. Map 45.

36. TIBET: Kongbo, Doshong La, 4000 m, *F.Ludlow*, *G.Sherriff* & *G.Taylor* 4676a (BM, UPS). CHINA SOUTH-CENTRAL: Sichuan, Mt Omei [Emei], Chiu-lo Tung, 2000 m, *F.T.Wang* 23312 (S). SULAWESI: Enrekang, Rante Mario, 3300 m, *P.J.Eyma* 879 (K).

A very variable taxon. Rarely, very young plants have the inflorescence only indistinctly storied. Plants from Taiwan and Malaya have tepals usually 2.5–2.8 mm long, longer than capsules. The Malayan plants have more numerous basal leaves and, on average, longer stolons. Intermediates between the two varieties are not rare.

23b. *Luzula effusa* var. *chinensis* (N.E.Br.) K.F.Wu, *J. E. China Norm. Univ., Nat. Sci. Ed.*, 1992(3): 92 (1992)

Luzula chinensis N.E.Br., *J. Linn. Soc., Bot.* 36: 161 (1903). T: China, [Sichuan] Szechuan, *A.Henry* 8829; syn: K; S (fragment); China, Szechuan, near Tibetan frontier, Tachienlu [Kangding], *A.Pratt* 360; syn: BM, K.

Plants usually 50–100 cm tall, robust; stolons short. Stem usually 2–6 mm in diam. Cauline leaves usually to 20 cm long and 10–21 mm wide. Tepals usually 1.9–2.3 mm long, paler reddish brown to brown. Anthers 0.5–0.6 mm long; filaments 0.6–0.8 mm long.

JUNCACEAE (*Luzula*)

Most frequently found in Sichuan and Yunnan, less common in Tibet, Hubei, Guizhou and N Burma. 36: CHC, CHT. 41: BMA. Mesic to humid woodlands. Map 46.

36. CHINA SOUTH-CENTRAL: Hubei [originally Hupeh, without detailed locality], *A.Henry* 6809 (K); Sichuan, Ta-hsiang-ling, 2700 m, *H.Smith* 2083 (UPS); Nanchuan-hsien, c. 200–2200 m, *W.P.Fang* 974 (E); 1157 (E, K); Omei [Emei] Shan, *E.H.Wilson* 5303, 5304 (BM, K); Yunnan, Yangbi Xian, W side of Diancang Shan, 3300–3600 m, *B.Bartholomew et al.* 423 (E). TIBET: Pome [Bomi], Tongkah, *F.Ludlow*, *G.Sherriff* & *R.H.J.Williams* 13770 (BM).

Extremely robust forms of var. *chinensis* are very different from the type variety but intermediates are known.

24. *Luzula alpinopilosa* (Chaix) Breistr., *Bull. Soc. Sci. Isére* 61: 609 (1947)

Juncus alpinopilosus Chaix, in D.Villars, *Hist. Pl. Dauphiné* 1: 318 (1786). T: *Haller* 1326 [A. von Haller, *Hist. Stirp. Helv.* 2: no. 1326 (1768)]; syn: P-Haller; France, Chaliol-le-Viel, *D.Chaix*; syn: G, n.v.

Luzula variabilis Buchenau, *Bot. Jahrb. Syst.* 7: 171 (1885), ['species collectiva'], *nom. illeg.*

Perennials 10–65 cm tall, subglabrous, loosely caespitose; rhizome branched, ascending; stolons often present, short. Basal leaves few, intermediate between cataphylls and cauline leaves; cauline leaves 3–5, 1.5–9.0 mm wide. All leaves with papillose-serrulate margins; apex acute. Lower bract herbaceous to subherbaceous, shorter than or rarely ±equalling inflorescence. Inflorescence a loose to subdense suberect or ±nodding panicle to 7 × 6 cm; flowers borne singly and in 2–3 (–7)-flowered clusters. Bracteoles ovate-lanceolate, 1.5–2.0 mm long, brownish, ciliate. Tepals ±equal, glabrous, lanceolate, with outer ones acuminate, 1.8–3.3 mm long, blackish brown to dark castaneous-brown; margins indistinct or very narrow. Stamens 6; anthers 0.6–1.2 mm long, 3–9 times longer than filaments; filaments 0.1–0.4 mm long; style 0.6–1.2 mm long; stigmas 1–2 mm long. Capsule ovoid to oblong-ovoid, subobtuse to ±acute, shortly mucronate, usually ±exceeding perianth, dark castaneous-brown, smooth; capsule segments usually 2.1–2.4 × 1.2–1.5 mm. Seeds pale brown, oblong-ovoid, 1.1–1.3 mm long, 0.6–0.7 (–0.9) mm wide; apex distinct, pale, to 0.1–0.2 mm long; basal appendage minute, as a paler patch to 0.1 mm long; base fibrillate.

Mountains of C and S Europe. Very variable in size, leaf width, tepal length and anther/filament length ratio. Three subspecies are recognized but numerous intermediates exist. Subalpine and alpine grasslands, rocky slopes, on gravel along streams, confined to silicic substrates.

- 1 Filaments 0.1–0.2 (–0.3) mm long; anthers 4–9 times longer than filaments 24b. subsp. **obscura**
- 1: Filaments 0.3–0.4 mm long; anthers usually 2–4 times longer than filaments
- 2 Cauline leaves 4–7 cm long, 1.5–5.5 mm wide; anthers usually 0.9–1.2 mm long; lower bract substantially shorter than inflorescence 24a. subsp. **alpinopilosa**
- 2: Cauline leaves 7–13 cm long, 4–9 mm wide; anthers usually 0.7–0.8 mm long; lower bract ±equalling inflorescence or shorter 24c. subsp. **deflexa**

UKRAINE: the East Carpathians, Mt Goverla, 2030 m, 7 Jul 1948, *E.Bradis & A.Zanjaratova* (MW); Zakarpatskaya area, Rachiv, Mt Turkul (1850 m) 16 km NE of Bogdan, 1740 m, 27 Jul 1996, *Z.Kaplan* 96/506 (PRA).

The overall variation of subsp. *obscura* is greater than that described in the protologue. In particular, narrow-leaved and small-flowered plants occur in populations of subsp. *obscura*. Some plants from Bulgaria (the Stara Planina Mtns) are intermediate between subsp. *obscura* and subsp. *deflexa*.

JUNCACEAE (*Luzula*)

MACEDONIA: Shar Planina, above Shtrbtse, 1900 m, *K. Vandas* (PR).

Very variable in size, tepal length and leaf width. In many characters it overlaps with those of subsp. *obscura*. Plants intermediate between subsp. *obscura* and subsp. *deflexa* occur in N Bulgaria; plants from Greece probably are similar.

Presumed hybrids

Luzula parviflora (Ehrh.) Desv. × *L. piperi* (Coville) M.E.Jones

Reputed hybrid, *sive* L. Hämet-Ahti, *Ann. Bot. Fenn.* 8: 378 (1971). The only specimen referred to the hybrid combination, [USA, Montana, Ravalli Co., C.L. Hitchcock & C.V. Muhlick 15340 (UC)] is reported to be seed sterile.

Luzula × *sichuanensis* K.F. Wu, *J. E. China Norm. Univ., Nat. Sci. Ed.*, 1992(3): 92 (1992), *pro sp.*

T: China, Sichuan, Maerkang Xian, Ma-tang, H. Smith 4385; holo: PE, photo TI, PRA; iso: UPS.

Plants to 50–60 cm tall; rhizome short, ascending; stolons short. Basal leaves to 25 cm long, 4–6 mm wide; caudine leaves (1–) 2–3 (–4), 8–12 cm long, 4–6.5 mm wide. All leaves subglabrous, with papillose-serrulate margins; apex acute. Inflorescence lax, to 12 × 12 cm, terminal (not storied), few-flowered; flowers borne singly; secondary branches long. Bracteoles ± entire, later sublacerate above. Tepals ± equal, lanceolate, (1.5–) 1.7–1.9 mm long, mid-brown to paler brown. Stamens 6; anthers 0.3–0.5 mm long (in the UPS isotype; original description gives 0.6–0.8 mm); filaments 0.4–0.5 mm long; style c. 0.4 mm long; stigmas 1.2–1.5 mm long. Capsule ± ovoid-ellipsoid, subacute, longer than perianth, dark

JUNCACEAE (*Luzula*)

castaneous-brown, smooth above; capsule segments $1.9\text{--}2.1 \times 1.3\text{--}1.4$ mm. Seeds 1.2–1.3 mm long, c. 0.7 mm wide; appendage indistinct; base fibrillate.

The type plant is intermediate between *L. parviflora* and *L. effusa* in many characters. The material is too scanty to allow a more definite conclusion; it may be a result of hybridization or old introgression, or alternatively, it may represent a local, isolated aberrant derived from *L. parviflora*. In addition to the above locality, similar plants but closer to *L. effusa* were identified from SW Sichuan, near Muli monastery, H.Handel-Mazzetti 7475 (WU); they are more robust and have slightly papillose capsules. All these intermediates seem to be fertile.

Sect. 5. ALPINAE

Luzula sect. *Alpinae* Chrtek & Křísa, *Preslia* 46: 211 (1974)

Luzula subsect. *Alpinae* (Chrték & Křísa) Kovtunyuk, Bot. Žurn. (Moscow & Leningrad) 72: 1399 (1987); *Luzula* sect. *Spicatae* K.F.Wu, J. E. China Norm. Univ., Nat. Sci. Ed., 1992(3): 101 (1992), nom. illeg. T: *Luzula spicata* (L.) DC.

Perennials. Leaves with acute to acuminate tips (mostly all leaves, sometimes only caudine ones). Lower bract herbaceous to membranous. Inflorescence usually nodding, less often erect (if so, then usually a ± compact single head), spike-like or paniculate, congested or interrupted at base. Seeds subglobular to ellipsoid; appendage indistinct, to 0.2 mm long or lacking; base fibrillate. Diploids or agmatoploids.

An intricate, not yet fully monographed group of 20 species distributed in the mountains of the northern hemisphere, and in South America and New Zealand, again mainly in high mountains. Here a new revision is presented but a number of questions remain unanswered.

- 1 Abaxial surface of basal leaves with thick white tomentum **25. L. ulophylla**

1: Abaxial surface of basal leaves glabrous (margins usually ciliate)

2 Plants stoloniferous

3 Stem 10–45 cm long; inflorescence ±nodding; stem much overtopping basal leaves; tepals reddish-blackish **42. L. vulcanica**

3: Stem less than 5 cm long; inflorescence ±erect; stem shorter than or scarcely equaling basal leaves, often not visible; tepals whitish-membranous with pale brown midrib **27. L. celata**

2: Stolons absent

4 Stamens 3, rarely 4–5

5 Inflorescence an interrupted panicle composed of remote panicles of spike-like flower clusters; inflorescence constitutes at least $\frac{1}{3}$ of plant height **32. L. ecuadoriensis**

6 Outer tepals usually 2.5–3.0 mm long; style 0.4–0.5 mm long; stigmas 1.0–1.2 mm long

6: Outer tepals usually up to 2 mm long; style 0.2–0.4 mm long; stigmas 0.5–0.7 mm long **33. L. excelsa**

5: Inflorescence ±spike-like (not composed of panicles of clusters), compact or interrupted or of usually 3–6 cylindrical ±pedunculate clusters; inflorescence constitutes less than $\frac{1}{5}$ of plant height

7 Tepals ciliate

8 Plants to 13 cm tall; stem thin, c. 0.3–0.4 mm diam. in upper part; inflorescence ±erect to slightly nodding, usually 2.5–5 cm long **43. L. antarctica**

8: Plants usually 20–60 cm tall; stem rigid, about 1 mm diam. in upper part; inflorescence nodding, usually 1.0–1.5 cm long **41. L. peruviana**

- 7: Tepals \pm glabrous (not to be confused with ciliate bracteoles)
- 9: Inflorescence usually distinctly nodding
- 10: Style 0.1–0.2 mm long; capsule segments 1.5–1.8 mm long; leaf margin \pm densely papillose-serrulate **40. L. racemosa**
- 10: Style 0.3–0.4 mm long; capsule segments 1.8–2.1 mm long; leaf margin \pm smooth **26. L. traversii**
- 9: Inflorescence erect to suberect
- 11: Inflorescence composed of 3–6 (10) distinct elongated cylindrical flower clusters; lower clusters pedunculate and upper subsessile **37. L. brachyphylla**
- 11: Inflorescence congested, usually a single head, ovoid to lobate, rarely interrupted at base; clusters \pm sessile
- 12: Basal leaves 4–9 mm wide; basal bract herbaceous; style c. 0.3 mm long. [Juan Fernández Is.] **35. L. masafuerana**
- 12: Basal leaves c. 1 mm wide; basal bract membranous; style c. 0.1 mm long. [NW Argentina] **44. L. ruiz-lealii**
- 4: Stamens 6, rarely 4 or 5
- 13: Tepals densely to sparsely ciliate **36. L. alopecurus**
- 13: Tepals \pm glabrous
- 14: Seeds (excluding basal appendage) more than 1.2 mm long
- 15: Seeds 2.1–2.4 mm long **30. L. pediformis**
- 15: Seeds less than 2.0 mm long
- 16: Anthers 2.0–2.9 mm long, at least 5 times as long as filaments **31. L. caespitosa**
- 16: Anthers less than 1.2 (–1.5) mm, up to 3 times as long as filaments
- 17: Style 0.6–0.9 mm. [S Europe] **28. L. pindica**
- 17: Style 0.3–0.6 mm. [South America]
- 18: Tepals \pm equal, c. 2.7–3.3 mm long; anthers usually 0.6–0.9 mm long; inflorescence \pm compact **38. L. chilensis**
- 18: Tepals unequal, with outer ones 3.5–4.8 mm long; anthers usually 0.7–1.5 mm long; inflorescence often interrupted at base **39. L. leiboldii**
- 14: Seeds (excluding basal appendage) less than 1.2 mm long
- 19: Inflorescence erect to suberect
- 20: Inflorescence of a single compact \pm ovoid head; cauline leaves absent; basal leaves \pm obtuse; basal bract membranous, to 1 cm long **44. L. ruiz-lealii**
- 20: Inflorescence composed of 3–6 (–10) distinct spike-like elongated cylindrical flower clusters; lower clusters pedunculate and upper ones subsessile; cauline leaves 1 or 2; basal bract herbaceous, 1.5–4.0 cm long **37. L. brachyphylla**
- 19: Inflorescence nodding
- 21: Inflorescence a panicle of remotely interrupted partial inflorescences, each of long pedunculate secondary panicles composed of 3–10 spike-like clusters; lowermost secondary panicle often 10–15 cm below the terminal one **34. L. mendocina**
- 21: Inflorescence congested in a single head, sometimes lobate or interrupted at base; basal clusters subsessile, not remote

25. *Luzula ulophylla* (Buchenau) Cockayne & Laing, *Trans. Proc. New Zealand Inst.* 43: 366 (1911)

Luzula racemosa var. *ulophylla* Buchenau, *Oesterr. Bot. Z.* 48: 245 (1898). T: New Zealand, South Island, Albertown, Lake Wanaka, D.Petrie; syn: W [seen in 1994, in 1998 not located]; Southern Canterbury Alps, Castle Hill Distr., 2200 ft., Dec 1894, L.C.Cockayne; syn: B, destroyed; Castle Hill, 1893, L.C.Cockayne; neo: WELT 12668, *fide* E.Edgar, *New Zealand J. Bot.* 4: 165 (1966); E.Edgar, *in* L.B.Moore & E.Edgar, *Fl. New Zealand* 2: 72 (1970).

Perennials (5–) 9–20 (–28) cm long, densely hairy, densely caespitose; rhizome short, vertical, ±many-headed; stolons absent. Basal leaves short, usually 3–6 cm long, (1–) 2–3 mm wide, usually inrolled, narrow, whole, or upper two thirds of abaxial surface with thick white tomentum; caudine leaves absent or 1 (–2), with blade reduced, filiform, 1–2 cm long; sheath to 2 cm long. All leaves with subulate acute tip; margins ±smooth. Lower bract ovate, straw-brown, membranous, c. 5 mm long, similar to middle bracts. Inflorescence erect, cylindrical to ±ovoid, densely congested, spike-like, usually 0.8–2.0 × 0.6–1.0 cm, of 1–5 few-flowered clusters. Bracteoles ovate, scarious, 1.5–2.0 mm long, ciliate near apex. Tepals ±entire, subequal, rarely ±denticulate near apex, (1.3–) 1.6–1.9 (–2.1) mm long, acuminate; lower middle part dark castaneous brown; margins broad, white-scarious. Stamens 3 (4–6); anthers 0.4–0.5 (–0.7) mm long; filaments 0.3–0.5 mm long; style c. 0.3 mm long; stigmas c. 0.5 mm long. Capsule obovoid, equalling or slightly exceeding perianth, ±obtuse to subacute, dark brown to black; capsule segments 1.5–2.0 × c. 1.1–1.3 mm. Seeds pale castaneous, 0.8–0.9 mm long, c. 0.6 mm wide; appendage minute, appearing as a paler basal fibrillate swelling to 0.1 mm long. 2n=48 [48CL], *fide* H.Nordenskiöld, *New Zealand J. Bot.* 4: 186 (1966); 2n=44, *fide* J.B.Hair, *New Zealand J. Bot.* 5: 18 (1967). Fig. 13.

Endemic to the South Is. of New Zealand. 51: NZS. Wind-eroded shingly open ground or grasslands, between 300 and 1500 m. Map 50.

51. NEW ZEALAND SOUTH: South Is., Otago, head of Eweburn Dam, H.E.Connor & H.Nordenskiöld S151 (UPS); C Otago, Queenstown, Ben Lomond, H.E.Connor & H.Nordenskiöld S189 (UPS); Canterbury, Acheron R., near diversion to Lake Coleridge, E.Edgar G5791 (CHR, PR); S Canterbury, Lake Tekapo, Boundary Stream, 13 Jan 1961, H.E.Connor (CHR 113675, K); Canterbury, Lake Heron, 720 m, A.D.Wilton 98048 (CHR, PRA).

Easily distinguished by the dense white tomentum on the abaxial surface of the leaves.

26. *Luzula traversii* (Buchenau) Cheeseman, *Man. New Zealand Fl.*, 2nd edn, 305 (1925)

Luzula racemosa var. *traversii* Buchenau, *Bot. Jahrb. Syst.* 12: 133 (1890). T: New Zealand, H.H.Travers; lecto: WELT 12718, *fide* E.Edgar, *New Zealand J. Bot.* 4: 164 (1966); E.Edgar, *in* L.B.Moore & E.Edgar, *Fl. New Zealand* 2: 71 (1970).

Perennials 10–40 cm tall, densely caespitose; rhizome short; stolons absent. Leaves with ±acicular tip and sparsely ciliate, with ±smooth margins. Lower bract herbaceous, exceeding inflorescence, 3–5 cm long. Inflorescence ±nodding, of (1–) 3–9 clusters congested into a lobate or pyramidal head up to 2–3 × 1.5 cm. Bracteoles ovate, entirely membranous, often castaneous at base, 1.5–2.0 mm long, ±entire or sparsely ciliate near apex. Tepals subequal, ±entire, usually with a dark castaneous brown midrib and broad whitish-membranous margins. Style 0.3–0.4 mm long; stigmas c. 1.0–1.2 mm long. Capsule subacute, equalling or ±exceeding perianth. Seeds 1.0–1.2 mm long, 0.6–0.7 mm wide; appendage indistinct, to 0.1 mm, fibrillate.

Endemic to the South Is. of New Zealand. Similar to *L. racemosa* but inflorescence not interrupted, tepals with broad scarious-membranous margins, and longer style, capsule segments and seeds. *L. masafuerana* differs from *L. traversii* in having broader leaves with papillose-serrulate margins, broader bracts and suberect inflorescence. Two varieties are recognized within *L. traversii*; intermediates are known (Canterbury, Cave Stream, N.T.Moar & H.Nordenskiöld S118, UPS). E.Edgar, *New Zealand J. Bot.* 4: 164 (1966), mentioned

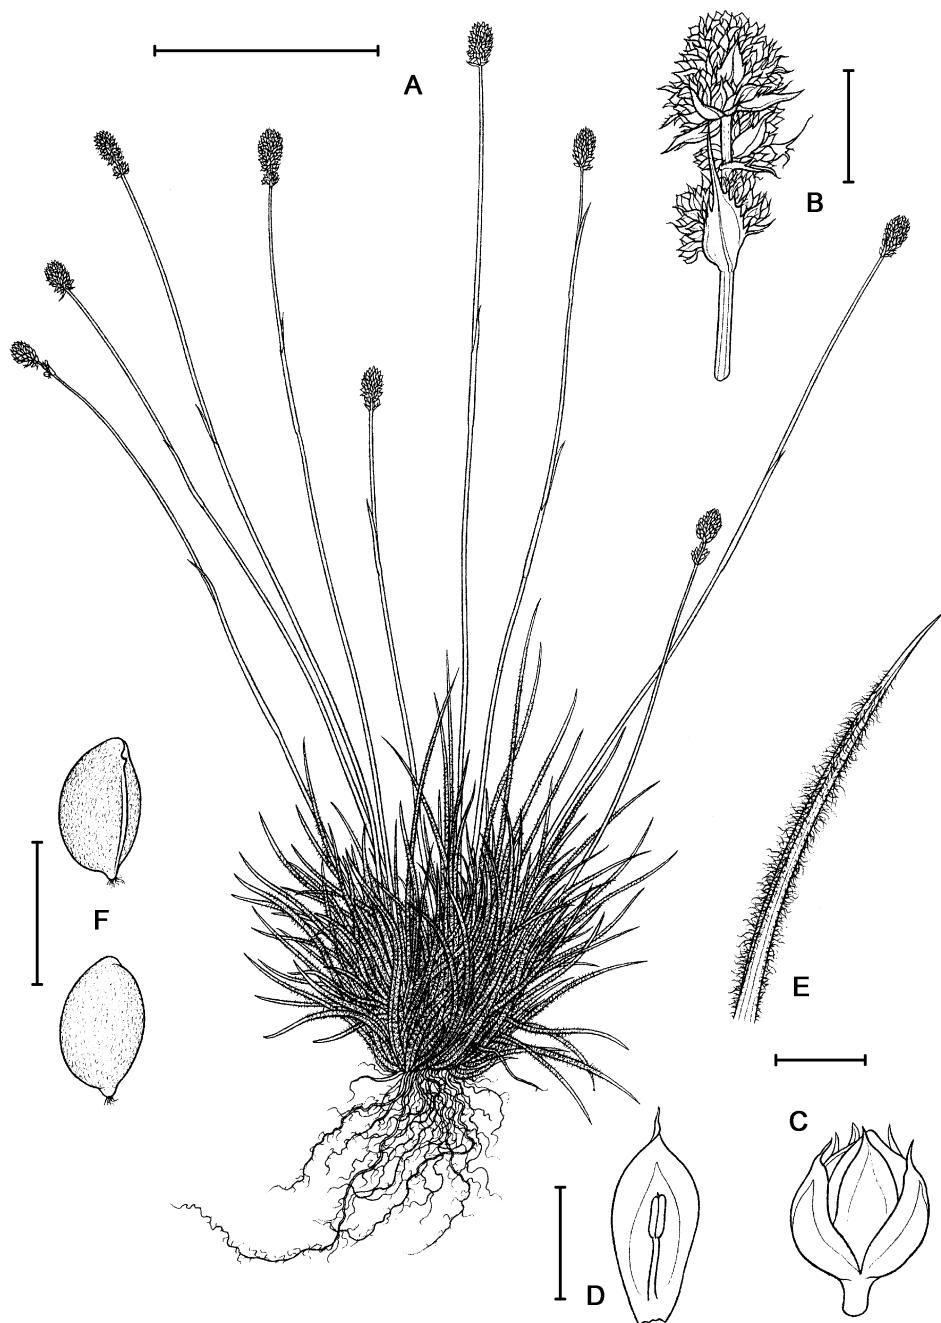

Figure 13. *Luzula ulophylla*. A, habit; B, inflorescence; C, perianth and capsule; D, tepal and stamen; E, leaf apex, note the abaxial surface indumentum and acute tip; F, seeds. (A, B, E. Edgar G5791, PR; C–F, H.E. Connor & H.Nordenskiöld S151, UPS). Scale bars: A = 5 cm; B = 5 mm; C = 1 mm; D = 1 mm; E = 1 cm; F = 1 mm. Drawn by © E.Smrčinová.

JUNCACEAE (*Luzula*)

dwarf plants from C Otago as a part of the variation range of *L. traversii*. The absence of herbaceous bracts might indicate a distinct taxon.

Stamens usually 3; anthers ±as long as filaments; basal leaves usually 2–4 mm wide **26a. var. *traversii***

Stamens usually 6; anther/filament ratio c. 2; basal leaves usually to 2 mm wide **26b. var. *tenuis***

26a. *Luzula traversii* (Buchenau) Cheeseman var. *traversii*

Basal leaves usually up to 12–15 cm long, (1–) 2–4 (–5) mm wide; caudine leaves 2 or 3, usually up to 6–7 cm long. Tepals 1.8–2.2 (–2.5) mm long. Stamens 3– (4–5); anthers 0.5–0.6 mm long; filaments 0.4–0.5 mm long. Capsule castaneous brown; capsule segments 1.8–1.9 × c. 1.2 mm. 2n=46 [46CL], *fide* H.Nordenskiöld, *New Zealand J. Bot.* 4: 186 (1966); 2n=32, *fide* J.B.Hair, *New Zealand J. Bot.* 5: 18 (1967).

Endemic to the South Is. of New Zealand. 51: NZS. Rocky slopes, 600–1500 m. Map 51.

Known only from a small area of C Otago, South Is., New Zealand. 51: NZS. Rocky slopes, 200–450 m. Map 52.

51. NEW ZEALAND SOUTH: South Is., C Otago, Lindis Valley, above Tarras, 31 Dec 1949, *McNeur* (CHR); Cromwell Gorge, near railway station, *H.H.Allan* (CHR50088); Cromwell Gorge, *E.Edgar* (K); Alexandra, *J.E.Holloway* (OTA2964); Alexandra, *A.Wall* (CANTY1787).

27. *Luzula celata* Edgar, *New Zealand J. Bot.* 4: 165 (1966)

T: New Zealand, South Is., Canterbury, Rangitata Valley, near Potts River bridge, 29 Oct 1964, *E.Edgar*; holo: CHR149586; iso: K.

Illustration: P.J.Lange, A.D.Wilton & C.Beard, *New Zealand Bot. Soc. Newslett.* 53: front cover (1998).

Perennials, loosely tufted, forming loose cushions up to 3 cm tall; rhizome creeping to ascending, branched; stolons present, with base covered with membranous-scarious cataphylls with distinct veins. Leaves up to 4 cm long, c. 0.5–1.0 mm wide, involute to canaliculate; apex acute; margins ±smooth, usually densely ciliate. Stem abbreviated, much shorter than leaves, often not visible. Lower bract 1 (–3), usually 0.5–1.0 cm long, base and middle part herbaceous, otherwise ±membranous. Inflorescence reduced to a single (very rarely two) (3–) 6–16-flowered cluster. Bracteoles scarious, c. 1 mm long, ciliate. Tepals ±equal, glabrous, ovate-lanceolate, 1.7–2.1 mm long, scarious with pale castaneous base and midrib. Stamens 3, equalling to slightly exceeding perianth; anthers 0.4–0.6 mm long; filaments 1.4–1.8 mm long. Capsule ±globular, subacute, pale brown, ±equalling perianth; capsule segments 1.8–2.0 × 1.7–1.8 mm. Seeds ellipsoidal, c. 1.0–1.2 mm long, c. 0.6–0.7 mm wide; appendage c. 0.1 mm long, fibrillate. 2n=12, *fide* E.Edgar, *New Zealand J. Bot.* 4: 165 (1966).

Endemic to South Island, New Zealand. 51: NZS. Sandy or shingly ground on old river terraces or in dune systems. Usually growing in, or near, cushions of *Raoulia australis* Hook.f. (Asteraceae). Map 53.

51. NEW ZEALAND SOUTH: South Is., Marlborough, Upper Awatere Valley, Muller Station, *L.B.Moore* (CHR77227); Ashburton R., Blowing Point, *A.Wall* (CANTY1737); Dunedin, Hoopers Inlet, *L.B.Moore* (CHR120151); Otago, Cromwell, Chafer Beetle Reserve, 210 m, *A.D.Wilton* 98223 (CHR, PRA); Otago, Crystall's Beach, Cooks Head, *A.D.Wilton* 98019 (CHR, PRA); Stewart Is. Mason Bay, E of Big Sandhill, *H.Wilson* (CHR).

Known from about 15 sites in the South Island and one site in Stewart Is.; vulnerable. This species is extremely elusive, and is easily overlooked.

28. *Luzula pindica* (Hausskn.) Chrtek & Křísa, *Webbia* 19: 6 (1964); *Notes Roy. Bot. Gard. Edinburgh* 25: 164 (1964)

Luzula spicata [unranked] *pindica* Hausskn., *Mitt. Thür. Bot. Ver.* 13–14: 33 (1899); *Luzula bulgarica* subsp. *pindica* (Hausskn.) Chrtek & Křísa, *Bot. Not.* 115: 308 (1962); *Luzula spicata* subsp. *pindica* (Hausskn.) Gamisans, *Candollea* 29: 42 (1974). T: Greece, Pindhos Mtns, Mt Zygos, Jul 1885, *H.C.Haussknecht*; syn: JE, W.

Illustration: J.Chrtek & B.Křísa, *Bot. Not.* 115: 309, fig. 7 (1962).

Perennials (15–) 20–35 (–45) cm tall, densely caespitose, sparsely hairy; rhizome short, vertical; stolons absent. Basal leaves ±flat, c. 3.5–6 (–9) cm long, of variable width, some usually 3.5–5.0 mm wide; cauline leaves 2–4, remote, c. 2–5 cm long, with lower ones often 3–4 mm wide and upper ones 2–3 mm wide, sometimes narrower (c. 1.0–1.5 mm wide). All leaves ±acute to subobtuse; margins densely papillose-serrulate. Lower bract sometimes remote, subherbaceous, very narrow, acute, c. 1–2 cm long, usually shorter than inflorescence; middle bracts conspicuous, membranous, whitish straw-brown, castaneous at base, lanceolate-aristate, usually 6–9 mm long. Inflorescence nodding (on arcuate upper part of stem), ±dense to inconspicuously interrupted at base, spike-like, usually 1.2–2.5 × c. 1 cm, of 2–7 few-flowered clusters. Bracteoles scarious, often brownish at base, ±ciliate, ovate-lanceolate, c. 2.5 mm long. Tepals subequal, glabrous, lanceolate, acuminate, usually 2.8–3.7 mm long, dark castaneous-brown, with narrow paler membranous margins. Stamens 6; anthers 0.9–1.2 mm long; filaments 0.3–0.4 mm long; style 0.6–0.9 mm long; stigmas c. 1.1–1.7 mm long. Capsule ±ovoid, subacute, pale to dark castaneous-brown, ±exceeding perianth; capsule segments 2.5–3.0 × 1.9–2.2 mm. Seeds subglobular, pale to dark brown, 1.4–1.8 mm long, 1.1–1.3 mm wide; appendage yellowish, c. 0.2 mm long, fibrillate. 2n=24, *fide* R.Franzén, in A.Strid & Kit Tan, *Mount. Fl. Greece* 2: 742 (1991).

Southern Europe: Balkan Peninsula and S Italy. 13: ALB, BUL, GRC, ITA, YUC. Subalpine meadows, usually on silicic rocks, usually between 1800 and 2500 m. Map 54.

13. ALBANIA: Permët, Biovëzhdë, Nemerçka Mtns, *A.Alston & N.Y.Sandwith* 1811 (K). BULGARIA: Pirin Mtns, Banderica, below Mt Vikhren, c. 2200 m, *J.Kirschner* 4465 (PRA). JUNCACEAE (*Luzula*)

Luzula spicata (L.) DC. var. *compacta* E.Mey., *Syn. Luzul.* 19 (1823); *Luzula compacta* (E.Mey.) Dalla Torre & Sarnth., *Farn- u. Blütenpfl. Tirol.* 1: 437 (1906), *non sensu orig., nom. superfl.*; *Luzula spicata* f. *compacta* (E.Mey.) I.Grint., *Fl. Rep. Soc. Roman.* 11: 596 (1966). T: Bohemia, 'Riesengebirge' [the Krkonoše Mts]; syn: A.J.Krocker, *Fl. Siles.* 5(1): tab. 52 (1787) [a mixture of elements belonging to subsp. *spicata* and subsp. *conglomerata* were given by E.Meyer; the name was validated through a reference to A.J.Krocker, *Fl. Siles.* 5(1): 572 (1787)].

Luzula spicata var. *relaxa* Krylov, *Fl. Alt. & Tomsk. Gub.* 6: 1401 (1912). T: not indicated.

Maps: E.Hultén, *Kongl. Svenska Vetenskapsakad. Handl.*, ser. 5, 7(1): map 218 (1958); H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 88 (1965).

Perennials, usually (5–) 10–30 (–40) cm tall, densely caespitose; rhizome short; stolons absent. Basal leaves numerous, usually 1.0–2.5 (–3.5) mm wide; cauline leaves 2–3 (–4); basal leaves ±acute to obtuse (not swollen); cauline leaves and bract acute, with margins ±densely papillose-serrulate. Lower bract subherbaceous or brownish membranous, shorter than or equalling inflorescence. Inflorescence nodding, rarely suberect, ±interrupted at base or not so, composed of clusters subtended by conspicuous middle bracts; middle bracts ovate-lanceolate, acuminate, membranous, ciliate. Tepals ±equal, glabrous, oblong-lanceolate, acuminate, brown, with indistinct paler margins distally. Stamens 6; style 0.2–0.4 mm long; stigmas 0.8–1.3 mm long. Capsules dark castaneous-brown, usually subacute. Seeds ±ellipsoidal, ±paler brown, (0.8–) 0.9–1.1 (–1.3) mm long, (0.5–) 0.6–0.7 mm wide; seed-coat distinct, forming a pale apex; appendage whitish-yellowish, 0.1 (–0.2) mm long, fibrillate.

A widely distributed complex of distantly disjunct populations confined to the Arctic and high altitudes in the N hemisphere mountains. Individual populations differ from one another in a series of mostly quantitative traits. The geographical variability is accompanied by an agmatoploid variation. The following 5 subspecies are recognized; some populations (in Turkey and the Alps) do not fit this pattern. The whole complex requires a detailed revision. A recent study (C.Garcia-Herran, *in litt.*) revealed a unique feature of the *L. spicata* group: partially fragmented ("aneuploid") chromosome sets in populations or groups of populations.

Note: Differences between the size of seeds, capsules and tepals given below and that reported in the literature is a consequence of a different method of measurement. Seeds (as everywhere in *Luzula*) are measured excluding the basal appendage, seen from above (dorsal view), tepals and capsule segments are first liberated from the inflorescence and measured separately.

Park, Mt Lineman, *A.Breitung* 14023 (S). 72. QUEBEC: E coast of Hudson Bay, Great Whale River, *O.Hedberg* 2624 (UPS). 75. NEW HAMPSHIRE: Mt Lafayette, *M.L.Fernald* [*Pl. Exs. Gray.J* 191 (LD, PRC, W, WU)].

Variable. Some plants from Greenland are exceedingly robust (described as *L. obtusata* Steud.); the aberrant variation probably depends on edaphic conditions. Plants from W USA and SW Canada require further study; towards the south, the western plants show a tendency to broader leaves, longer tepals and broader seeds. The stamen and seed characters, however, are within the subsp. *spicata* limits. If the western plants prove to represent a distinct taxon, two names, var. *nova* Smiley, and subsp. *saximontana* Á.Löve & D.Löve, are referable to it.

Map: J.Chrtek & B.Křísa, *Bot. Not.* 115: 305, fig. 5 (1962).

JUNCACEAE (*Luzula*)

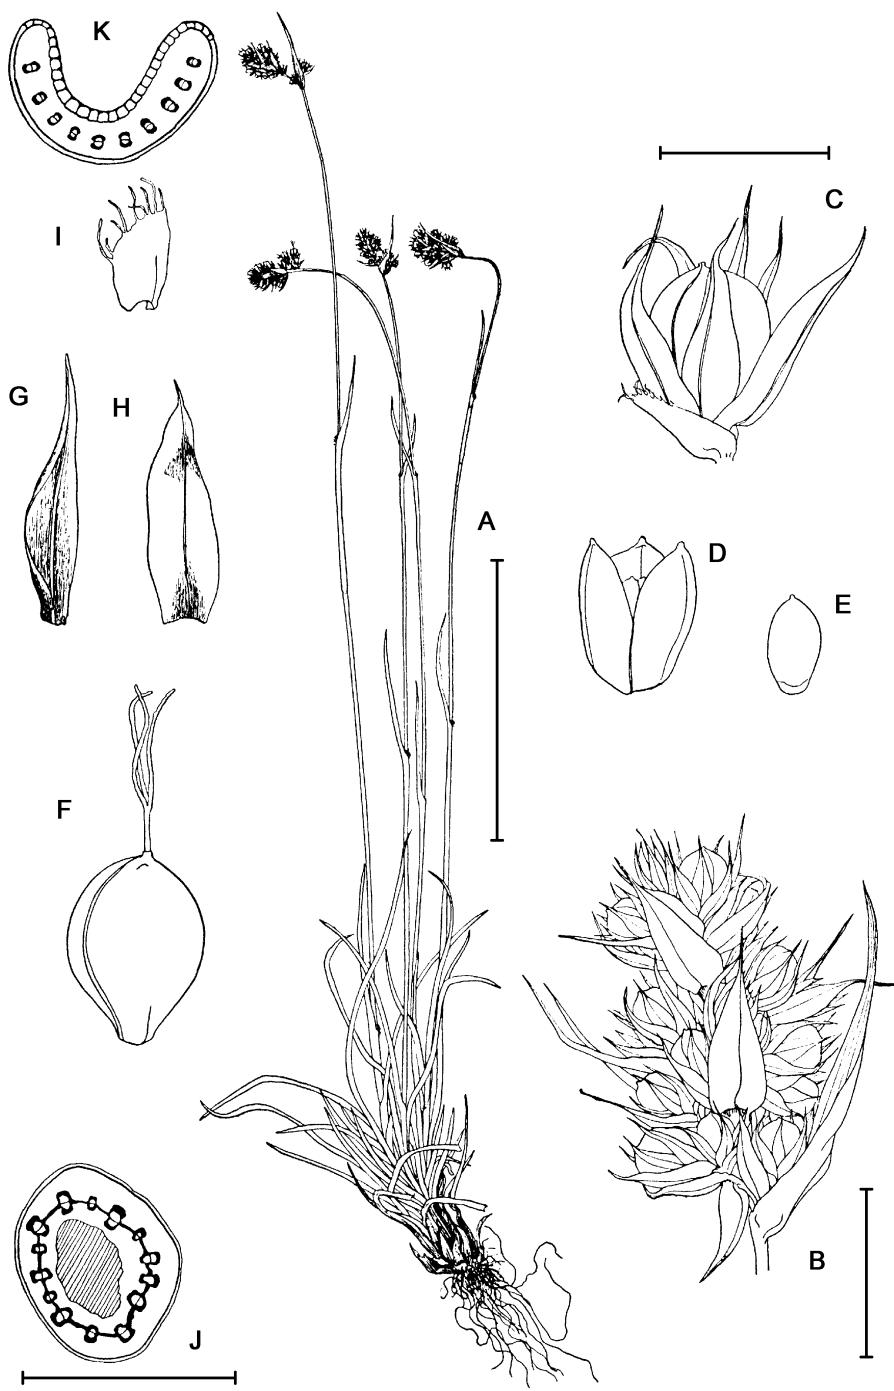

Figure 14. *Luzula spicata* subsp. *conglomerata*. A, habit; B, partial inflorescence; C, perianth and capsule; D, capsule; E, seed; F, immature capsule with style and stigmas; G, H, tepals; I, bracteole; J, stem T.S.; K, leaf T.S. (A. Rehman s.n., KRA). Scale bars: A = 5 cm; B = 5 mm; C-I = 2 mm; J, K = 1 mm. Drawn by T.Szynal. Reproduced with permission, from T.Szynal & J.Mądalski, *Atlas Fl. Pol.* 2/2: 146 (1931).

Plants 7–15 (–20) cm tall. Basal leaves up to 1.5–2.0 mm long. Basal bract often ±equalling inflorescence. Inflorescence ±abbreviated, subglobose, not interrupted, rarely lobate, up to 1.5×1.0 cm. Tepals usually 1.8–2.4 (–2.7) mm long. Anthers 0.3–0.5 (–0.6) mm long, ±equalling filaments; filaments c. 0.4–0.5 mm long. Style 0.2 mm long; stigmas c. 1.0 mm long. Capsule segments 1.5–2.1 \times c. 1.1–1.2 mm. Seeds 0.9–1.2 \times c. 0.6 mm; appendage c. 0.1 mm long. 2n=12, *fide* H.Nordenskiöld, *Hereditas* 37: 334–335 (1951); J.Májovský & A.Murín, *Karyotax. Prehl. Fl. Slov.* 362 (1987); 2n=18 [6AL+12BL], 2n=24 [24BL], *fide* C.Garcia-Herran, *in litt.* Fig. 14.

Mountains of C and SW Europe: the Carpathians, the Alps and N Italy, the Pyrenees and N Iberian mountains, Swiss Jura. 11: AUT, CZE, GER, POL, SWI. 12: FRA, SPA. 13: ITA, ROM, YUC-SL. 14: UKR. Oligotrophic, wind-eroded alpine tundra. Map 56.

11. AUSTRIA: Kärnten, Hohe Tauern, Mallnitz, 2460 m, 19 Aug 1919, G.Beck (PRC); Kärnten, Heiligenblut, Pasterze Glacier, D.H.Hoppe (PR); Tirol, Sterzing, Riedberg, 2500–2700 m, R.Huter [*Fl. Exs. Austro-Hung.*] 3914 (PR, PRC, UPS). POLAND: Tatry Wysokie, Rysy, 2200–2500 m, B.Pawlowski [*Pl. Polon. Exs.*] 84 (K, KRA, KRAM). SLOVAKIA: Vysoké Tatry, Skalnaté pleso, 14 Jul 1943, F.Nábělek (SAV). SWITZERLAND: Valais, between Riffelberg and Gornergrat, 2500–3000 m, F.O.Wolf [*A.Kneucker, Cyper. Junc. Exs.*] 180 (PR). 13. ROMANIA: Bucegi Mtns, 2000 m, 5 Jul 1904, J.Prodan (PR); 25 Jul 1970, I.Morariu *et al.* (LD).

Very variable. While in the E Alps subsp. *conglomerata* is easily distinguishable from subsp. *spicata*, in the W Alps the limit is not so clear-cut, and karyological variation has also been observed. The type of the name *L. spicata* subsp. *montsignatica* has anther length and anther/filament ratio at the upper limit of the subspecies; further study is needed.

29c. *Luzula spicata* subsp. *mongolica* Novikov, *Nov. Sist. Vyssh. Rast.* 26: 34 (1989)

A variable complex of regional populations characterized by long anthers, usually much longer than the filaments, usually interrupted or distinctly lobate inflorescence, and large capsule segments and seeds. Local populations often are relatively distinctive, deviating from the average values in a number of quantitative characters. However, numerous substantial overlaps of the quantitative character ranges do not allow recognition of the local types at a rank higher than variety. A unique feature is the multiple, fixed occurrence of 2n=16=8AL+8BL in the Caucasus.

29e. *Luzula spicata* subsp. *nevadensis* P.Monts., *Anales Inst. Bot. Cavanilles* 21(2): 478 (1964)

Illustration: S.Pignatti, *Fl. Ital.* 3: 447 (1982).

Perennials (25–) 30–55 (–85) cm tall, loosely caespitose. Rhizome long, horizontal to oblique, branched, c. 4–6 mm in diam.; upper part covered with dark castaneous-brown leaf sheath bases; older sheath remains often forming dark brown fibrous cover; stolons absent. Stem thick, usually 1.5–2.3 mm in the middle, with upper part nodding. Basal leaves ±flat, usually 10–20 cm long, (4–) 5–6 (–8) mm wide; leaves of intravaginal shoots narrower; cauline leaves 3–4 (–5), usually 5–9 cm long; all leaves ±densely ciliate, densely papillolose-serrulate, acute with hyaline apex. Lower bract usually narrow, herbaceous (rarely lacking), usually equalling or overtopping inflorescence. Inflorescence nodding, (15–) 20–45 (–80)-flowered, spike-like, lobate, often interrupted at base, usually 2.0–3.5 (–5.0) × 1.0–1.5 cm, composed of 3–10-flowered clusters, with lower 1 (–2) clusters often remote, ±pedunculate. Bracteoles 2.5–3.5 mm long, ±ovate, acuminate, ciliate, brownish-membranous. Tepals subequal, castaneous brown with broad straw-brown membranous margins, c. 4.5–6.0 × 1.5–2.0 mm; outer tepals long acuminate, entire to (later) denticulate; inner tepals usually denticulate near apex, mucronate. Stamens 6; anthers 2.2–2.9 mm long; filaments c. 0.5–0.7 mm long; style 1.8–2.2 mm long; stigmas usually 2.5–3.0 mm long. Capsule paler castaneous-brown, acute to ±acuminate, ±mucronate; capsule segments 3.7–4.8 × c. 2.5–2.7 mm. Seeds pale brown, broadly ovoid, 2.1–2.4 mm long (including a 0.2–0.4 mm long apical caruncle), c. 1.5 mm wide; basal appendage an indistinct paler patch c. 0.1 mm long; base fibrillate. 2n=12, *fide* C.García-Herran, *in litt.*; C.Favarger & P.Küpfer, *Collect. SPAIN: Asturias, Leitariegos, Cueto de Arvas, P.Font Quer & W.Rothmaler [*Fl. Iber. Sel.*] 205 (BCF, S, UPS); Asturias, Pico de Arvas, Jul 1898, M.Gandoger (W); Palencia, Pico de Curavacas, 16 Jul 1990, C.Garcia-Herran (NEU90-1038; 2n=12); León, Picos del Mampodre, Cervunal de Valverde, 1800–1900 m, 5 Aug 1952, T.M.Losa & P.Montserrat (BCF4129); León, Hayedo del Gildar, 1900 m, Garcia-Gonzales (JACA109685); Madrid/Segovia, Sierra de Guadarrama, Siete Picos, Cercedilla – La Granja, 2080–2120 m, V.J.Aran & M.J.Toha (JACA172898, MA); Soria, Laguna Negra, 21 Jul 1991, C.Garcia-Herran (NEU91-1089; 2n=12); Soria, Coraleda, Pico de Urbión, 2000–2200 m, J.L.Benito (JACA19895).

A species variable in the size of its vegetative parts and in the shape and size of its inflorescence. The variation shows considerable overlaps between local populations, and extremes are scattered throughout the species' range. Thus, the aberrant plants described by P.Montserrat as subspecies are here subsumed within the species.

32. *Luzula ecuadorensis* Balslev, *Fl. Ecuador* 11: 11 (1979)

T: Ecuador, Cotopaxi, 3550 m, 1939, E.Asplund 6494; holo: S; iso: S.

Illustration: H.Balslev, *Fl. Neotrop. Monogr.* 68: 62, fig. 31 (1996).

Map: H.Balslev, *Fl. Neotrop. Monogr.* 68: 63, fig. 32 (1996).

Perennials 50–75 cm tall, sparsely hairy to subglabrous; rhizome ascending. Basal leaves (5–) 10–20 (–25) cm long, usually 6–10 mm wide; caudine leaves usually 3–5, with sheath to 7 cm long, usually 9–15 cm long, up to 10 mm wide; all leaves acute with densely papillose-serrulate margins. Lower bracts similar to leaves, up to 17 cm long, distally gradually shorter (lower inflorescence branches often in axils of upper or middle caudine leaves). Inflorescence an interrupted ±drooping panicle in upper $\frac{1}{3}$ (– $\frac{1}{2}$) of plant height, composed of dense oblong-ovoid partial inflorescences on long primary peduncles; further composed of

cylindrical to oblong spike-like clusters 1–2 × 0.4–0.8 cm. Bracteoles membranous, ±lanceolate, 1.5–2.0 mm long, fimbriate-ciliate above. Tepals ±castaneous brown, subequal, with outer tepals (2.3–) 2.5–3.0 mm long, lanceolate, acuminate, glabrous or very sparsely ciliate; margin pale, indistinct to ±absent. Stamens usually 3, sometimes 4–5; anthers 0.4–0.5 mm long; filaments 0.6–0.7 mm long; style 0.4–0.5 mm long; stigmas c. 1.0–1.2 mm long. Capsule subglobose to ovoid, paler castaneous brown; capsule segments 1.5–1.8 × c. 1.2 mm, glossy. Seeds c. 1.0 mm long, 0.5–0.6 mm wide; seed-coat distinct, forming a pale apex; basal appendage c. 0.1 mm long, fibrillate. Fig. 15.

Illustration: M. Barros, *Darwiniana* 10: 323, fig. 12 (1953).

Perennials 25–60 cm tall, sparsely hairy caespitose; rhizome short; stolons absent. Basal leaves usually 12–15 cm long, 3.5–6.5 mm wide. Cauline leaves 2–3; upper ones usually short, 3–6 cm long, 2.5–3.5 mm wide. All leaves acute-subulate; margins with sparse reddish papillae. Primary bracts herbaceous, of variable length, usually 2.5–5.0 cm long. Inflorescence panicle composed of remotely interrupted, relatively dense, long pedunculate secondary panicles. Secondary panicles 2–4 × 1–2 cm, with lowermost often 10–15 cm below terminal one, of 3–10 spike-like dense clusters. Bracteoles scarious-membranous, 1–2 mm long, ±lanceolate, not or sparsely ciliate. Tepals subequal, entire, glabrous, lanceolate, acuminate; inner tepals 2.0–2.5 mm long; outer tepals 2.1–2.8 mm long. Stamens 6, rarely 1 or 2 rudimentary; anthers 0.6–0.8 mm long; filaments 0.3–0.4 mm long; style 0.3–0.4 mm long; stigmas 0.8–1.1 mm long. Capsules narrowly ovoid, ±acute, brown, shining, shorter than perianth; capsule segments 1.5–1.7 × 1.0–1.1 mm. Seeds oblong-ovoid, c. 0.8–1.0 mm long, 0.6–0.7 mm wide; appendage indistinct, base fibrillate.

Map: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 88 (1965).

Perennials usually 10–35 cm tall, densely hairy caespitose; base often purplish, robust; rhizome short; stolons absent. Stem rigidly erect, (0.6–) 0.8–1.2 mm in diam. below inflorescenceBasal leaves densely ciliate, numerous, 8–15 (–18) cm long, 4–5 (–6) mm wide; caudine leaves unevenly distributed, usually with one near stem base and 1 or 2 close to inflorescence, 6–10 cm long, often overtopping inflorescence; all leaves acute, with margins papillose-serrulate. Lower bract herbaceous, c. 2–5 cm long, usually overtopping inflorescence; upper bracts scarious-brownish, fimbriate-ciliate, up to 2 cm long. Inflorescence erect, densely congested, c. 1.5–2.5 cm long, of whitish villose appearance when younger, rarely with a small separate flower cluster at base. Bracteoles inserted c. 0.5–1.0 mm below flower; upper bracteoles narrowly lanceolate with a filiform tip, c. 3.0–3.5 mm long (often as long as flowers), densely fimbriate-ciliate. Tepals subentire, with outer ones densely and inner ones usually very sparsely long ciliate, narrowly lanceolate, acuminate with filiform tip, ±unequal (inner tepals 2.5–2.9 mm long, outer tepals 2.9–3.7 mm long), purplish castaneous brown to straw brown at base, with broad membranous border. Stamens 6; anthers 0.4–0.7 mm long; filaments 0.5–0.9 mm long, longer than anthers; style 0.1–0.2 mm long; stigmas c. 1.0 mm long. Capsule oblong-ovoid, ±trigonous above, ±acute, castaneous brown, shorter than perianth; capsule segments 1.8–2.0 × 1.3–1.4 mm. Seeds ellipsoidal, with distinct yellowish seed-coat and yellowish apex, dark castaneous, 0.9–1.0 mm long, 0.5–0.6 mm wide; appendage yellowish, 0.1–0.2 mm, fibrillate. 2n=24, *fide* D.M.Moore, *Fl. Most plants from Chile and from the southern part of the range are triandrous, with occasional occurrence of flowers with 4–6 stamens. Plants from Santa Cruz, Chubut and Neuquén, Argentina, are predominantly hexandrous (flowers with 3–5 stamens sometimes found in the same inflorescence as hexandrous ones). Differences in stamen number is the only significant variation found within the species (the names *L. patagonica* and *L. correae* refer to the predominantly hexandrous form).

Luzula chilensis f. *longifolia* Barros, *Darwiniana* 10: 322 (1953). T: Argentina, Neuquén, Río Alumine, Otto Asp. 98; syn: BAF; Chubut, Río Percey, 6 Feb 1945, *A.Castellanos*; syn: LIL114302.

Perennials, usually 12–25 (–55) cm tall, caespitose, sparsely to ±densely hairy; rhizome short; stolons absent. Basal leaves (5–) 6–8 (–12) cm long, 2.5–3.5 (–6) mm wide; caudine leaves 2, usually short, 1.5–3.0 cm long; all leaves acute, with margins distinctly papillose-serrulate. Lower bract membranous-brownish, rarely herbaceous, usually 1.5–2.0 cm long, ciliate, ±equalling inflorescence. Inflorescence usually congested as a single slightly nodding or ±suberect head c. 2 × 1.5 cm, of 5–6 clusters (usually 3–6-flowered); less often clusters distinct, ±interrupted, inflorescence about 5 cm long. Bracteoles scarios with straw-brown base, ovate, acuminate, fimbriate-ciliate, 1.5–2.0 mm long. Tepals ±equal, glabrous, lanceolate, c. 2.7–3.3 mm long, acuminate-aristate, pale castaneous brown below and on midrib, otherwise membranous to pale straw-brown. Stamens 6; anthers usually 0.6–0.9 mm long; filaments 0.4–0.5 mm long; style 0.3–0.4 mm long; stigmas 1.2–1.6 mm long. Capsule ovoid to subglobular, ±obtuse, castaneous brown, shining, equalling or shorter than perianth; capsule segments 2.4–3.0 × 1.5–2.1 mm. Seeds paler castaneous brown; seed-coat distinct, forming a yellowish apex, 1.2–1.5 mm long, (0.9–) 1.0–1.2 mm wide; appendage (0.1–) 0.2 mm long, fibrillate. Fig. 17.

Most common in S and C Chile and S and W Argentina, reaching Valparaiso (district of Aconcagua) in C Chile. 85: AGS, AGW, CLC, CLS. Distribution imperfectly known. Wet mountain slopes and grasslands, usually below 2000 m, rarely above 3000 m. Map 68.

JUNCACEAE (*Luzula*)

85. ARGENTINA NORTHWEST: Mendoza, Malarhue, Valle de Las Leñas, *R.Kiesling & A.Donath* 7262, 25 Dec 1989 (SI, MCNS). ARGENTINA SOUTH: Neuquén, Cordillera del Viento, Cerro las Yeguas, *A.Pastore* 46 (S); Chubut, Lago Vintter, 1360–1450 m, *S.Halloy* A-93 (LIL); Santa Cruz, Río de las Vueltas, Estancia Pérez, 1200 m, *H.Sleumer* 1382 (LIL); Santa Cruz, Lago Argentino, 400 m, *P.Dusén* 5777 (S, SI, UPS). CHILE CENTRAL: Valparaíso, Petorca, Río Sobrante, 3100–3300 m, *J.L.Morrison* 17310 (S, SI); La Araucanía, Cautín, Volcán Llaima, 1200–1300 m, *E.Werdermann* 1232 (LIL, S, SI); Valparaíso, Aconcagua, Portillo, 3000 m, *E.Wall* 1727 (S). CHILE SOUTH: Ñuble, Baños de Chillán, 2100 m, *F.W.Pennel* 12442 (S, SGO); Libertador, Cordillera del Peuco, 1886, *R.A.Philippi* (SGO).

The obvious type of the name *L. chilensis* was destroyed in B but details were depicted and described by F.G.P.Buchenau, *Junc. S.-Amer.* 418 (1879). The seed size, 6 stamens, and inflorescence shape clearly identify *L. chilensis*. The type of *L. rigida* does not bear Philippi's annotation of the name but the detailed description (with a number of measurements and individual features) allows identification of the type and its equation with *L. chilensis*.

39. *Luzula leiboldii* Buchenau, *Junc. S.-Amer.* 418 (1880)

Juncoidea leiboldii (Buchenau) Kuntze, *Revis. Gen. Pl.* 2: 734 (1891). T: Chile, *F.E.Leibold* 2969; holo: W, not located; iso: S.

Illustration: M.Barros, *Darwiniana* 10: 326, fig. 13 (1953).

Perennials 12–30 cm tall, densely caespitose, hairy; base thick, with extravaginal erect shoots; stolons absent. Basal leaves usually 5–10 cm long, 3.5–5.0 mm wide; caudine leaves 1 or 2, 3.5–6.0 cm long, 2.0–3.0 mm wide; all leaves acute, rarely subobtuse, with margins ±smooth to sparsely papillose, sparsely ciliate. Lower and middle bracts castaneous-membranous, with prominent veins, aristate, ciliate, up to 1.5 cm long; upper bracts c. 5 mm, similar to tepals. Inflorescence erect to suberect, rarely slightly nodding, usually interrupted at base, 'echinate' with erecto-patent acute bracts, usually 1.5–2.0 (–3.0) cm long, usually of 3–7 few-flowered clusters subtended by conspicuous middle bracts. Bracteoles acuminate, membranous, 2.5–3.0 mm long. Tepals glabrous to sparsely ciliate, pale to castaneous brown at base, membranous-scarious above, acuminate-aristate, ±unequal; outer tepals 3.5–4.8 mm long; inner tepals 2.7–3.7 mm long. Stamens 6; anthers (0.7–) 0.8–1.2 (–1.5) mm long, filaments 0.4–0.6 mm long; style 0.5–0.6 mm long; stigmas 1.5–2.0 mm long. Capsule ovoid, subacute, deep castaneous, shorter than perianth; capsule segments 2.4–2.9 mm long. Seeds [unripe] 1.5–1.7 mm long, c. 1 mm wide; appendage indistinct, c. 0.1 mm long, fibrillate.

Recorded from Santiago province, Chile, and Mendoza and Neuquén, Argentina. 85: AGS, AGW, CLN. Habitat unknown. Map 69.

85. ARGENTINA NORTHWEST: Mendoza, Calmucó, *A.Burkart et al.* 13849 (SI13849). ARGENTINA SOUTH: Neuquén, Lacar, Cordón del Cerro Colorado (Between Lago Lacar and Lago Lolog), 25 Jan 1986, *L.Bernardello & Moscone* 620 (CORD). CHILE NORTH: Santiago, Rio Yeso, Lago Negro, 2700 m, *W.Biese* 937 (LIL); 'Cordillera de Santiago', *R.A.Philippi* (SGO, BM); Santiago, Cerro de Ramón, 2650 m, *C.Ysandino* (SGO).

Closely related to *L. chilensis*, and perhaps only an infraspecific taxon of it. *Luzula leiboldii* is distinct in having longer tepals, longer anthers with higher anther/filament ratio, and tepals sometimes hairy. The material available is too scanty for evaluation of variation ranges.

40. *Luzula racemosa* Desv., *J. Bot. (Desvaux)* 1: 162, tab. 6, fig. 3 (1808)

Perennials (5–) 10–35 (–40) cm tall, caespitose, hairy; rhizome short, erect or ascending; stolons absent. Stem thin, nodding in upper part. Basal leaves canaliculate or flat, 5–18 cm long, typically 2.0–2.5 (–4.0) mm wide; caudine leaves (0–) 1 or 2, usually remote, narrow, usually 3.5–7 cm long; all leaves acute, with margins papillose-serrulate. Lower bract usually herbaceous, very narrow, up to 4–5 cm long, shorter than inflorescence; bracts supporting flower clusters linear-lanceolate, pale brownish-membranous, ciliate, up to 1 cm long, usually shorter than clusters. Inflorescence nodding, spike-like, (1.0–) 1.5–5 × 1.0–1.5 cm, of 3–8 elongated clusters, ±interrupted (rhachis visible), rarely compactly congested in high mountain forms (then only 1–1.5 cm long). Bracteoles ±membranous, 1.2–1.5 (–2.0) mm long, ovate, acuminate, ciliate. Tepals ±unequal, ±glabrous (rarely with few teeth or hairs), dark castaneous brown with paler apex and margins; outer tepals usually 2.0–2.4 (–3.0) mm long, lanceolate, acuminate-aristate; inner tepals 1.7–2.1 (–2.4) mm long. Stamens 3, rarely 4–5; anthers 0.3–0.5 mm long; filaments 0.3–0.6 mm long; style 0.1–0.2 mm long; stigmas 0.6–0.9 mm long. Capsules oblong-ovoid, usually ±obtuse, shorter than perianth, paler brown; capsule segments usually 1.5–1.7 (–1.8) × 0.9–1.1 mm. Seeds pale brown, shining, with darker apex, (0.7–) 0.9–1.0 mm long, c. 0.6 mm wide; appendage distinct, yellowish, 0.1–0.2 mm long, sparsely short fibrillate. 2n=24, *fide* J.H.Beaman, *Amer. J. An extremely variable species in most features of general habit. In various regions plants have features blurring the otherwise distinct limits of the species. In Mexico, flowers are close to the upper size limit, in Ecuador, an intermediate between *L. racemosa* and *L. chilensis* was found (Sayausí, *G.Harling* 1424, S). Plants in Argentina have a tendency towards longer peduncles of lower clusters, a feature found in related species. The plasticity of vegetative traits, depending often on available moisture and altitude, is also enormous. The whole complex is in a need of a detailed cultivation and karyological study.

JUNCACEAE (*Luzula*)

Illustration: H.Balslev in *Fl. Ecuador* 11: 17, fig. 5 (1979).

Perennials up to 60 cm tall, caespitose, hairy; rhizome vertical or ascending; stolons absent. Stem thick, rigidly erect, with only the uppermost part nodding. Basal leaves numerous, often squarrose, rigid, flat or canaliculate, usually 5–10 cm long and 2–4 mm wide; caudine leaves 2–4, densely hairy, to 13 cm long, evenly distributed on stem, often overlapping; all leaves acute, indistinctly papillose-serrulate. Lower bract herbaceous, densely hairy, up to 5 cm long, overtopping inflorescence; middle bracts supporting flower clusters purplish-brownish membranous, lanceolate, aristate, densely ciliate, c. 0.8–1.5 (–2.0) cm long, often exceeding the partial inflorescence. Inflorescence erect to slightly nodding, compact (rhachis usually not visible), usually 2.5–5 × c. 1.5 cm, often lobulate, rarely interrupted at base, dark castaneous brown, composed of c. 3–8 dense clusters. Bracteoles castaneous-membranous, ovate-lanceolate, aristate, 2.0–2.5 mm, long ciliate. Tepals subequal or irregularly unequal, lanceolate, acuminate and aristate, usually ciliate, dark castaneous brown; upper part membranous with prominent midrib; longest tepals in flower 3.0–4.4 mm long. Stamens 3; anthers 0.3–0.4 mm long; filaments 0.6–0.9 mm long; style 0.1–0.2 mm long; stigma 0.5–1.1 mm long. Capsule oblong-ovoid, subacute to obtuse, paler brown; capsule segments 1.8–2.2 × 1.3–1.4 mm. Seeds paler brown, with darker apex, ellipsoidal, 1.1–1.4 mm long, c. 0.7 mm wide; appendage scarcely visible, c. 0.1 mm long, densely long fibrillate (seeds difficult to release from capsule).

Centred to Ecuador and Peru, rare in Colombia, Bolivia and northernmost Argentina, with an isolated station in C Mexico; further exploration needed. 79: MXC. 83: BOL, CLM, ECU, PER. 85: AGW. In páramos, grasslands, rocky slopes, usually between 3800 and 4500 m. Map 71.

79. MEXICO CENTRAL: Tlaxcala, Malinche, 4400–4450 m, J.H.Beaman 2223 (UPS). 83. BOLIVIA: La Paz, Murillo, Laguna Zongo, 4740 m, J.Brandbyge 582 (AAU). ECUADOR: Chimborazo, Mt Chimborazo, 4550 m, E.Asplund 7938 (S, UPS); Pichincha, Páramo de Guamani, 3800–4100 m, H.Balslev 1618 (AAU); Imbabura, Volcán Cotocachi, 3900–4100 m, S.Laegaard 54498 (AAU). PERU: Puno, Aranca, 4100–4300 m, F.W.Pennell 13456 (S); Huaron, 4500 m, J.F.Macbride & F.Featherstone 1132 (S); Ancash, Carhuaz, Quebrada Ulta, 4400–4600 m, D.N.Smith 11338 (AAU, MO). 85. ARGENTINA NORTHWEST: Salta, Santa Victoria, Cochita, Ruta 5, foot of cerro Campanario, 30–35 km W of Santa Victoria, 4100–4200 m, L.J.Novara 6683 (MCNS); Tucumán, Cumbres Calchaquies, Callejones, 18 Feb 1915, L.Castillón (LIL 50636).

Variable, and in many features similar to *L. racemosa*. Main diagnostic characters are its ciliate longer tepals, longer seeds with smaller, densely fibrillate appendage, and the habit of the inflorescence. Flowers of both species indicate autogamy but intermediates of unknown nature are known from Ecuador and Peru.

42. *Luzula vulcanica* Liebm., *Vidensk. Meddel. Dansk Naturhist. Foren. Kjøbenhavn* 2: 44 (1850)

T: Mexico, Veracruz, Mt. Orizaba, 4250 m, F.Liebmann; lecto: C, fide H.Balslev, *Fl. Neotrop. Monogr.* 68: 65 (1996) [as ‘holo’]; isolecto: C, GH, HAL, K, P, S.

Illustration: H.Balslev, *Fl. Neotrop. Monogr.* 68: 66, fig. 34, A, B (1996).

Map: H.Balslev, *Fl. Neotrop. Monogr.* 68: 63, fig. 32 (1996).

Perennials c. 10–45 cm tall, sparsely hairy; rhizome ascending to erect; stolons usually long, ascending. Stems erect, often slightly curved near the top (in the opposite direction to the nodding inflorescence). Basal leaves 3–15 cm long, usually 2–4 mm wide; caudine leaves usually 2, usually in upper half of stem, 1–5 (–11) cm long; all leaves acute, with papillose-serrulate margins. Bracts all scarious; lower bract membranous or castaneous (purplish), broadly lanceolate, c. 1 cm long, fimbriate-ciliate. Inflorescence a terminal spike like head, dark (reddish) castaneous brown, 1–4 × 0.5–1.2 cm, usually of 2–5 clusters, congested to slightly interrupted, suberect, if nodding then only the inflorescence not the upper part of stem. Bracteoles 1.5–2.0 mm long, usually castaneous-membranous. Tepals dark, reddish-blackish, subequal, glabrous, usually 2.7–3.7 mm long, acuminate. Stamens 3; anthers 0.4–0.5 mm long; filaments 0.8–1.0 mm long; style 0.1–0.2 mm long; stigmas c. 0.5–0.8 mm long. Capsule oblong-ovoid, ± trigonous above, paler castaneous; capsule segments 1.6–1.9 ×

1.0–1.2 mm, finely rugose. Seeds ellipsoidal, paler brown, 0.9–1.0 mm long, 0.5–0.6 mm wide; appendage c. 0.1 mm long, fibrillate. Fig. 18.

43. *Luzula antarctica* Hook.f., *Fl. Antarct.* 1: 359 (1847)

Juncoides antarctica (Hook.f.) Macloskie, *Rep. Princeton Univ. Exp. Patagonia, Bot.* 8: 302 (1904). T: Chile, Cape Horn, Hermite Is., *J.D.Hooker* 14; holo: K.

Perennials 7–13 cm tall, densely caespitose, densely to sparsely hairy; rhizome short, vertical; stolons absent, plant base greyish straw-brown. Upper part of stem 0.3–0.4 mm in diam., arcuate. Basal leaves usually 3–5 cm long, ±flat to canaliculate, c. 2.0–3.0 (–3.5) mm wide, acute; margins subglabrous to densely ciliate, smooth or very remotely papillose. Cauline leaves (1–) 2, 1.5–3.5 cm long, c. 1.5 mm wide, acute. Lower bract (or uppermost leaf) usually slightly remote from inflorescence, brownish-membranous (or ±herbaceous), hairy, narrow, less than 2 cm long; upper bracts narrowly triangular to lanceolate or ovate-lanceolate, dark castaneous brown, paler above, c. 0.7–1.0 cm long. Inflorescence small, 1.0–1.5 × 0.7–0.9 cm, nodding, compact, dark castaneous brown, few-flowered. Bracteoles ±lanceolate to narrowly triangular, castaneous brown to membranous-brownish, paler near apex, usually 2.5–4.0 mm long. Tepals unequal; inner tepals 2.8–3.4 mm long; outer tepals 3.8–4.7 mm long, lacerate ciliate, dark castaneous brown (including bases of ciliae), lanceolate, acuminate, aristate (with a filiform tip). Stamens (0–2) 3; anthers 0.3–0.6 mm long; filaments 0.7–0.8 mm long; style c. 0.2 mm long; stigmas 1.0–1.2 mm long; gynoecium in some flowers rudimentary, but in most there are rudiments of 1 (–2) stamens. Capsule dark brown, ovoid to subglobular, subobtuse, shorter than perianth; capsule segments usually 2.0–2.3 × 1.1–1.2 mm. Seeds ellipsoidal, brown; seed-coat not distinct, 1.0–1.1 mm long, 0.6–0.7 mm wide; appendage yellowish, 0.10–0.15 mm long, fibrillate.

Tierra del Fuego and adjacent territories, rare. 85: AGS, CLS. Exposed rocky slopes, grasslands. Map 73.

85. SOUTH ARGENTINA: Tierra del Fuego, Cerro Almanza, Lashifashaj, 900–1000 m, *D.M.Moore* 1415 (H, K); Ushuaia, *H.Rovainen* 2321 (H). CHILE SOUTH: Tierra del Fuego, Río Azopardo, 600 m, 9 Mar 1896, *P.Dusén* 652 (UPS); 3 Mar 1908, *C.J.F.Skottsberg* 849 (S); Isla Desolación, Puerto Angusto, 300–400 m, 8 Apr 1896, *P.Dusén* 709 (UPS); Sierra Valdiviesa, Río Betbedero, 11 Mar 1908, *C.J.F.Skottsberg* s.n. (SGO, UPS).

Usually compared or synonymized with *L. alopecurus* on the basis of shared irrelevant characters [see D.M.Moore & M.C.Doggett, *Bol. Soc. Argent. Bot.* 17: 150–154 (1976)], but closer to the *L. racemosa* group. Distinct from the former in having three stamens and dark, nodding inflorescence, from the latter it can be distinguished by the compact inflorescence and much longer tepals.

Illustrations: M.Barros, *Darwiniana* 10: 343, fig. 19 & 357, fig. 25 (1953).

Perennials to 15 cm tall, dwarf, densely caespitose, cushion-forming, subglabrous to sparsely hairy; rhizome ±erect, ±many-headed; stolons absent, with base covered with numerous brownish remains of leaf bases. Basal leaves rigid, glabrescent or ciliate, thick, canaliculate,

JUNCACEAE (*Luzula*)

Figure 18. *Luzula vulcanica*. **A**, habit, note stolons; **B**, flower. *L. racemosa*. **C**, habit, note lack of stolons; **D**, flower. (A, B, B.Øllgaard & H.Balslev 9891, AAU; C, D, P.R.Bell 78, A). Scale bars: **A**, **C** = 5 cm; **B**, **D** = 2 mm. Drawn by K.Tind Originally published in G.Harling & B.Sparre (eds.), *Fl. Ecuador* 11: 15, fig. 4; 17, fig. 5 (1979), reproduced with permission, from H.Balslev, *Fl. Neotrop. Monogr.* 68: 66, fig. 34 (1996), © Lunds Botaniska Förening, © 1996, The New York Botanical Garden.

3–4 cm long, c. 1 mm wide, with ±obtuse to subobtuse tip and margins ±smooth; caudine leaves absent. Basal bract pale straw-brownish membranous, oblong-lanceolate, acute, ciliate, up to 1 cm long. Inflorescence spike-like, densely congested, terminal, cylindrical-ovoid, 1.0–1.5 × c. 0.7–0.8 cm, of 2–6 few-flowered clusters, or rarely of 1–3 remote basal clusters. Bracteoles whitish scarious, ovate, acuminate, ciliate, to 1.5–1.8 mm long. Tepals glabrous, ±equal, pale straw-brown or membranous above, brown below, acuminate (subaristate), with inner tepal ±mucronate, usually 2.1–2.6 mm long. Stamens 3–5 (–6); anthers 0.4–0.6 mm long; filaments 0.4–0.6 mm long; style c. 0.1 mm long; stigmas to 1 mm long. Capsule ovoid, subacute, paler brown, shorter than perianth; capsule segments 1.6–1.8 × c. 1.0 mm. Seeds 1.0–1.1 mm long, c. 0.6 mm wide; appendage yellowish, c. 0.2 mm long, fibrillate.

Endemic to Mendoza, Argentina. 85: AGW-ME. Open patches in dry grasslands, above 3000 m. Map 74.

85. ARGENTINA NORTHWEST: Mendoza, San Carlos, Laguna del Diamante, 3200 m, 16 Jan 1952, *A.Ruiz Leal 14584* (SI); 16 Jan 1949, *A.Ruiz Leal 11717* (LIL264113, MERL); Mendoza, Tunuyán, Valle del Alto Tunuyán, Cerro Pan de Azúcar, 6 Feb 1934, *A.Ruiz Leal 2140* (LIL, MERL).

A peculiar dwarf form, superficially similar to *L. ulophylla* of New Zealand. Number of stamens varies within inflorescence and cannot be used to separate *L. ruiz-lealii* and *L. parvula*. Suspected to be a depauperate form parallel to that of *L. racemosa* (*L. macusaniensis*) but cannot be equated with any of the southern hexandrous forms.

Doubtful names:

Luzula psilophylla Phil., *Linnaea* 33: 267 (1865)

Luzula chilensis f. *psilophylla* (Phil.) Fuentes, *Bol. Mus. Nac. Hist. Nat.* 90: 138 (1917). T: In Andibus 'Talcaregue'. [J.Gay]; holo: n.v.

The type material has not been located. The protologue description does not give relevant information, and later herbarium material annotated by Philippi is taxonomically heterogenous, including *Luzula leiboldii*, *L. chilensis* and *L. brachyphylla*.

Luzula chilensis var. *pallida* Buchenau ex Fuentes, *Bol. Mus. Nac. Hist. Nat.* 90: 138 (1917)

T: [not indicated].

Luzula subsect. *Nivales* [Chrtek & Křísa ex] Kovt., *Bot. Žurn. (Moscow & Leningrad)* 72: 1399 (1987). T: *Luzula nivalis* (Laest.) Spreng.

Perennials. Leaves with tip acute, acuminate or mucronate. Lower bract short, membranous to brownish-membranous. Inflorescence subcongested, or in glomerules on thin peduncles which are usually arcuate or nodding, less often straight. Seeds ellipsoidal to narrowly ellipsoidal; appendage basal, short, up to 0.2 mm long, or lacking; base fibrillate.

Five species, almost confined to the Arctic and rare in the mountains in northern temperate regions. They represent a link between sect. *Diprophyllatae* and the type section. In particular, *L. arcuata* and *L. confusa* may have an allopolyploid origin of the above parentage, as indicated by their karyotypes (Nordenskiöld, 1949, 1951).

- 1 Basal leaves usually 4.5–6.0 mm wide, bluish green; plants usually tall, 20–40 cm tall [California] **45. *L. subcongesta***
- 1: Basal leaves usually narrower than 4 mm; plants usually less than 20 cm tall [circumpolar but north of California]
 - 2 Basal leaves with obtuse, often slightly swollen tip with a spinuliform mucro; seed base with appendage c. 0.2 mm long and fibrillate **49. *L. nivalis***
 - 2: Basal leaves subabruptly to gradually narrowing to acute or acuminate tip; seed base with short (to 0.1 mm long) appendage or without appendage, and always fibrillate
 - 3 Plant base straw-brown to dull brownish; flower clusters pale brown to straw-brown, ellipsoidal **46. *L. kjellmaniana***
 - 3: Plant base brown to purplish or reddish, usually shining; flower glomerules or clusters dark to blackish brown, ±globular or ellipsoidal
 - 4 Peduncles c. 0.2 mm in diam., with secondary branches, usually arcuate to nodding; glomerules (1–) 2–6 (–8)-flowered, broader than wide; number of glomerules usually 5–10; stem less than 0.5 mm in diam. below inflorescence **47. *L. arcuata***
 - 4: Peduncles c. 0.3 mm in diam., without secondary branches, usually straight, erect, less often arcuate; subsessile clusters more than 10-flowered; number of clusters usually 1–3; stem 0.5–0.9 mm in diam. below inflorescence **48. *L. confusa***

Syst.* 12: 110 (1890); *Juncoidea parviflora* var. *subcongesta* (S.Watson) E.Sheld., *Bull. Geol. Nat. Hist. Surv.* 9: 63 (1894); *Juncoidea subcongesta* Coville, *Muhlenbergia* 1: 105 (1904). T: California, Sierra Nevada, near Donner Lake, J.Torrey; syn: *n.v.*

Illustration: Jepson, *Fl. Calif.* 1: 259, fig. 45c, d, e (1921).

Map: J.Coffey Swab, *Fl. North Amer.* 22: 267 (2000).

Perennials, loosely tufted, subglabrous, bluish green, with horizontal rhizome. Stem 20–40 cm long; caudine leaves 3–4, usually 3–5 cm long, 3–6 mm wide; basal leaves up to 10 (–15) cm

long, usually 4.5–6 mm wide; all leaves with distinctly acute tip, papillose-serrulate margins and sparse hairs near sheath. Inflorescence bracts straw-membranous or with reddish tinge; lower bracts up to 1.5 cm long, ciliate. Inflorescence up to 4–6 cm long, corymbose with 4–20 glomerules on capillary arcuate peduncles c. 0.2 mm in diam., each distally branched; glomerules usually 3–7-flowered. Bracteoles usually c. 1.5 cm long, ciliolate. Tepals equal, 1.7–2.1 mm long, 0.5–0.6 mm wide, ovate-lanceolate, acute, entire, dark brown. Stamens 6; anthers 0.3–0.6 mm long; filaments 0.5–0.7 mm long; style c. 0.3 mm long; stigmas c. 1.0 mm long. Capsule ovoid with subconical top, shorter than tepals; capsule segments dark brown, lustrous, 1.6–1.8 × 0.9–1.1 mm. Seeds narrowly ellipsoidal, 1.1–1.2 × 0.6 mm, medium brown, distally apiculate, with fibrillate base; appendage missing. 2n=24 [BL], H.Nordenskiöld, *Hereditas* 37: 330–331, 1951. Fig. 19.

Endemic to California. 76: CAL. Gravelly stream and lake banks, grassy patches among rocks, usually at or above 3000 m. Map 75.

76: CALIFORNIA: Sierra Nevada, Tuolumne Co., head of Virginia Canyon, c. 3200 m, C.W.Sharsmith 4148 (DS, K, S, UC); Tulare Co., Rock Ck, c. 3400 m, J.T.Howell 25567 (CAS, S); J.T.Howell 26216A (UPS); Mono Co., Hall Natural Area, c. 3000 m, A.R.Moldenke & H.N.Moldenke 24653 (AAU); Mono Co., Cascade Lake, NE of North Peak, 3300 m, J.Clausen 1934 & A.R.Kruckeberg (K); Shasta Co., Mt. Perennials 8–20 cm tall; rhizome ascending, long, without stolons. Basal leaves 5–8 cm long, 3–4 mm wide; sheath bases straw-brown to dull brownish. Cauline leaves 2(–3), usually 2.5–4.0 cm long, up to 2.5 mm wide. All leaves ±flat with leaf tip subobtuse, often with a short acute mucro; margins papillose-serrulate. Lower bract short, membranous, brownish at base. Inflorescence composed of 1–2 sessile and 1–4 pedunculate clusters (these sometimes composed of a few smaller sessile subclusters, rarely whole inflorescence subcongested); clusters ellipsoidal, usually 6–7 × 4 mm, pale brown to straw-brown; peduncles capillary, erect to arcuate. Bracteoles usually 1.5–1.8 mm long, pale brownish to membranous, fimbriate-ciliate. Tepals subequal (outer longer by 0.2–0.4 mm), 2.0–2.6 mm long, medium brown with broad membranous to stramineous margin above, entire. Stamens 6; anthers 0.4–0.5 mm long; filaments 0.5–0.7 mm long; style 0.2–0.3 mm long; stigmas c. 0.8 mm long. Capsule subacuminate, usually shorter than tepals; capsule segments ellipsoidal, brown, 1.5–1.6 × 1.0 mm. Seeds narrowly ellipsoidal, 0.9–1.0 × 0.5–0.6 mm, brown; appendage minute, less than 0.1 mm long; base fibrillate. 2n=36 [12'AL', 24'BL'], L.Hämet-Ahti & Virrankoski, *Ann. Bot. Fenn.* 8: 157, 1971. Perennials 10–25 cm tall; rhizome ascending; stolons ascending, usually 2–3 cm long. Leaves ±flat, sparsely ciliate, subabruptly narrowing to an acute tip; basal leaves usually 8–12 cm long, 3–4 (–5) mm wide; sheath base brown to purplish; caudine leaves 1–3, to 3–5 (rarely 8) cm long, 1.5–3.0 mm wide; sheaths sparsely ciliate above. Stem 0.3–0.4 (–0.5) mm diam. below inflorescence. Lower bract usually 5–8 (–15) mm long, brownish-membranous. Inflorescence usually corymbose with (2–) 6–10 (–17) glomerules; glomerules usually of (1–) 3–6 flowers each; peduncles capillary, arcuate, often nodding, often branched, usually reddish. Bracteoles ±ovate-lanceolate, c. 1.5 mm long, brownish to membranous, ciliate. Tepals ±equal, usually 2.0–3.0 × 0.6–0.8 mm, ovate to lanceolate, acuminate, often ciliolate, medium to pale brown. Stamens 6; anthers 0.4–0.6 mm long; filaments 0.4–0.5 mm long; style 0.3–0.4 (–0.5) mm long; stigmas 1.1–1.5 mm long. Capsule ellipsoidal with a short beak, shorter than tepals; capsule segments pale brown to brown, $1.9\text{--}2.2 \times 1.0\text{--}1.4$ mm. Seeds brown, narrowly ellipsoidal, $1.0\text{--}1.1 \times$ c. 0.6 mm; appendage very short, up to 0.15 mm long; base fibrillate (on the top of caruncle). $2n=36$, G.S.Knaben, *Nytt Mag. Bot.* 15: 244 (1968).

A variable subspecies; in Asia, towards the southeast, a gradual increase in perianth and capsule size can be observed, and plants from Japan often have solitary flowers on peduncles. The Japanese plants have often been referred to as *L. wahlenbergii*; literature records under the latter name from NE China may also refer to subsp. *unaliaschensis*.

Perennials, usually 10–15 (–20) cm tall, sparsely hairy, loosely to densely caespitose with ascending densely branched to simple rhizome, sometimes with short ascending vegetative shoots; plant base usually deep purple-brown, shiny. Basal leaves up to 6–9 cm long, ±subcanaliculate to ±flat, 1.5–2.5 mm wide; tip acuminate; caudine leaves 1–2, usually 2–4 cm long, 1.0–1.5 mm wide. Stem 0.5–0.9 mm in diam. below inflorescence. Lower bract membranous, less often brownish-membranous, usually 4–9 mm long. Inflorescence composed of one sessile and often 1–2 pedunculate clusters; peduncles without secondary branches, erect, straight, less often arcuate or recurved, c. 0.3 mm in diam.; sessile cluster bigger (sometimes with a discernible basal subcluster), usually more than 10-flowered, 7–10 × 6–7 (–9) mm; pedunculate clusters smaller, 5–12 (–14)-flowered, 5–6 (–7) × 4–5 (–6) mm. Bracteoles ±ovate, brownish, c. 1 mm long; membranous apex fimbriate-ciliate. Tepals ±equal, usually 2.0–2.3 mm long, ±acuminate to acute, dark brown. Stamens 6; anthers 0.4–0.5 mm long; filaments 0.5–0.7 mm long; style c. 0.2 mm long; stigmas 0.8–1.0 mm long. Capsule ±ovate, with top rounded, ±not mucronate, shorter than or equaling tepals, blackish brown to dark castaneous brown; capsule segments ovate, 1.8–2.0 × c. 1.3–1.4 mm. Seeds narrowly ellipsoidal, 1.0–1.1 × 0.6 mm, ±pale brown, distally dark apiculate; base fibrillate; appendage not visible. 2n=36, Á.Löve & D.Löve, *Univ. Colorado Stud. Ser. Biol.* 24: 26 (1966). JUNCACEAE (*Luzula*)

Presumed hybrids

Luzula arcuata (Wahlenb.) Sw. subsp. *unaliaschkensis* (Buchenau) Hultén × *L. confusa* Lindeb.

Intermediate plants are found at sites with both presumed parents. Up to now known only from Alaska [L.Hämet-Ahti, *Ann. Bot. Fenn.* 10: 128 (1973)]. They usually exhibit a partial seed-sterility.

Luzula arcuata (Wahlenb.) Sw. subsp. *arcuata* × *L. confusa* Lindeb.

Plants intermediate between the two taxa are quite common in Greenland, Scandinavia, Finland and W North Russia. The presumed hybrid plants set normal seeds and require further study.

Luzula ser. *Inaequales* K.F.Wu, *J. E. China Norm. Univ., Nat. Sci. Ed.*, 1992(3): 97 (1992)

Perennials. Leaves with obtuse, usually slightly swollen tips. Lower bract herbaceous. Inflorescence wholly congested or umbelloid, decompound, of one to numerous spike- or head-like clusters each usually 3–many-flowered. Seed appendage basal, usually conspicuous, 0.1–0.8 mm long, fibrillate or not so. Diploids, true polyploids and complete or partial agmatoploids.

A section of 57 species with several diversity centres in Europe, the Far East, Australia, New Zealand, W North America and S America, grouped in this treatment by their regions of predominant occurrence. There is a very low level of major structural differentiation within the section, and many taxa are difficult to distinguish from one another. In some regions (W North America, China) the section is in need of taxonomic revision.

Successful identification by means of the following key requires careful measurement of well developed material, preferably of more than a single plant. Method of measurement, as given in the introductory part to the genus, should be observed.

JUNCACEAE (*Luzula*)

- 14: Peduncles smooth in the middle part
- 17 Flower clusters loose at base and/or some flowers ±remote
- 18 Capsule segments 1.9–2.1 mm long; seeds 0.6–0.7 mm wide [S Italy] **52. *L. calabria***
- 18: Capsule segments longer than 2.3 mm, seeds usually wider than 0.7 mm [NW and C America]
- 19 Style 0.6–1.2 mm long; seeds 0.9–1.1 mm wide **98. *L. subsessilis***
- 19: Style up to 0.6 mm long; seeds 0.7–0.9 mm wide
- 20 Tepals dark to blackish brown, 2.0–2.8 mm long **103. *L. caricina***
- 20: Tepals pale straw-brown to pale brown, (2.5–) 3.0–4.0 mm long **99. *L. comosa***
- 17: Flower clusters (evenly) dense, without remote flowers
- 21 Seed appendage usually 0.5 mm or more
- 22 Inflorescence wholly congested, or sometimes some of the clusters on erect peduncles
- 23 Anther/filament length ratio c. 1.0; basal leaves usually 3.5–6.0 mm wide **58. *L. congesta***
- 23: Anther/filament length ratio c. 2.0; basal leaves usually 2.0–3.5 mm wide **68. *L. capitata***
- 22: Inflorescence of pedunculate clusters; if partly congested then some of the peduncles flexuose or recurved and nodding
- 24 Plants with long creeping rhizomes and frequent ascending stolons **56. *L. campestris***
- 24: Plants densely to loosely caespitose; rhizomes short or short-ascending; stolons absent
- 25 Rhizome short-ascending, short-noded, usually with a few pale swollen reduced leaves; flower clusters cylindric to ±ovoid **101. *L. bulbosa***
- 25: Rhizome short, vertical, without swollen reduced leaves; flower clusters broadly ovoid to hemispherical
- 26 Capsule distinctly exceeding perianth **71. *L. lutescens***
- 26: Capsule shorter than perianth
- 27 Seeds 0.9–1.0 mm wide; anthers usually longer than 2.0 mm [C and SC Europe] **55. *L. divulgata***
- 27: Seeds 0.6–0.8 mm wide; anthers up to 1.5 mm long [E North America] **100. *L. echinata***
- 21: Seed appendage usually 0.4 mm or less (very rarely to 0.5 mm)
- 28 Leaf margins ±smooth, without dense papillose serrulation, rarely with solitary, often reddish papillae
- 29 Leaf tip acute to subobtuse with an acute mucro **91. *L. acutifolia***
- 29: Leaf tip obtuse, often ±swollen
- 30 Rhizome creeping-ascending, branched, plants therefore very loosely caespitose; stolons present or absent
- 31 Stem reduced, to 2 cm long; inflorescence usually 2–10-flowered **80. *L. decipiens***
- 31: Stem longer than (10–) 15 cm; inflorescence usually many-flowered

- 32** Inflorescence usually of 1–2 (–4) elongated heads
c. 5–20 × 5–10 mm, each composed of 3–7 (–10) spike-like, subcylindrical, shortly pedunculate to subsessile clusters [Papua-New Guinea] **72. *L. papuana***
- 32:** Inflorescence ±umbellloid, of one to several subsessile and several pedunculate clusters [New Zealand] **81. *L. picta***
- 30:** Rhizome short, indistinct or ascending, unbranched, plants therefore densely caespitose; stolons absent
- 33** All but 1–2 (–3) clusters pedunculate
- 34** Style 0.5–0.9 mm long; stigmas 1.5–2.5 mm long [Hawaiian Is.] **102. *L. hawaiiensis***
- 34:** Style usually 0.9–1.5 mm long; stigmas 2.0–3.5 mm long [New Zealand] **82. *L. banksiana***
- 33:** All or most clusters congested, forming a single head; occasionally, some clusters may be pedunculate
- 35** Seed appendage 0.2–0.3 mm long **87. *L. ovata***
- 35:** Seed appendage 0.1 (–0.2) mm long
- 36** Tepals dark brown to blackish; margins dark castaneous, narrow; seeds 0.5–0.6 mm wide **75. *L. crinita***
- 36:** Tepals pale brown to deep castaneous-brown; margins distinct, broad, pale brownish to scarious; seeds 0.6–0.8 mm wide
- 37** Tepals usually 1.7–2.5 mm long **77. *L. rufa***
- 37:** Tepals usually 2.6–4.0 mm long
- 38** Basal leaves usually 3–8 mm wide **82. *L. banksiana***
- 38:** Basal leaves usually 1.5–4 mm wide
- 39** Basal leaves stiff, canaliculate, with margins subglabrous to sparsely ciliate; seeds 0.6–0.7 mm wide [New South Wales] **86. *L. australasica***
- 39:** Basal leaves ±flaccid, not distinctly stiff, with margins densely to sparsely ciliate; seeds c. 0.8 mm wide [Chile] **104. *L. tristachya***
- 28:** Leaf margin ±densely papillose-serrulate
- 40** Capsule distinctly exceeding perianth; tepals to 1.8 mm long **69. *L. oligantha***
- 40:** Capsule as long as perianth or shorter; tepals longer than 1.8 mm
- 41** Inflorescence of 1–5 (–6)-flowered clusters; clusters numerous, more than 15 [Hawaiian Is.] **102. *L. hawaiiensis***
- 41:** Inflorescence of (5–) 6–many-flowered clusters; clusters few, rarely to 15
- 42** Anther/filament length ratio 3–5 **73. *L. philippinensis***
- 42:** Anther/filament length ratio 0.5–3
- 43** Tepals usually 4.5–6.0 mm long [Lord Howe Is.] **94. *L. longiflora***
- 43:** Tepals usually up to 4.2 mm long
- 44** Seeds usually 0.9–1.0 mm wide; seed appendage 0.4–0.6 mm long; seeds 1.2–1.5 mm long; tepals straw-brown to mid-brown **58. *L. congesta***
- 44:** Seeds up to 0.8 mm wide; seed appendage to 0.4 mm long; seeds 0.8–1.2 mm long, if seeds up to 1.3 mm then tepals dark castaneous-brown to blackish-brown

JUNCACEAE (*Luzula*)

- 45** Plant base usually bulbous; seed appendage usually 0.3–0.4 mm long; seeds 0.8–0.9 mm long [Australia] **85. *L. densiflora***
- 45:** Plant base not bulbous; seed appendage 0.1–0.3 mm long; if appendages 0.3–0.4 mm long then seeds 1.0 mm or longer
- 46** Tepals up to 2.4–2.5 mm long
- 47** Seeds 0.5–0.6 mm wide
- 48** Plants with long, branched, oblique or ascending rhizomes; stolons present or absent
- 49** Anthers c. twice as long as filaments; seed appendage c. 0.2 mm long **65. *L. abchasica***
- 49:** Anthers ± as long as filaments; seed appendage to 0.1 mm long **57. *L. sudetica***
- 48:** Plants densely caespitose; rhizome short; stolons absent
- 50** Style 0.4–0.6 mm long [Caucasus and NE Anatolia] **64. *L. stenophylla***
- 50:** Style 0.1–0.3 mm long
- 51** Inflorescence with 1–3 pedunculate clusters (in addition to subsessile ones); peduncles 1.5–4.0 cm long [Japan] **71. *L. nipponica***
- 51:** Inflorescence wholly congested, or rarely one cluster on peduncle to 1.5 cm long [North America or Greenland]
- 52:** Tepals dark, usually blackish brown; seed appendage c. 0.2 mm long; seeds 0.8–0.9 (–1.0) mm long [California] **97. *L. orestera***
- 52:** Tepals brown to castaneous-brown; seed appendage c. 0.1 mm long; seed 1.0–1.1 mm long [arctic and subarctic North America and Greenland] **96. *L. groenlandica***
- 47:** Seeds 0.7–0.8 mm wide
- 53** Plants with long, branched stoloniferous rhizomes [Tropical Africa] **60. *L. mannii***
- 53:** Plants with short rhizomes; stolons absent [outside Africa]
- 54** Pedunculate clusters 5–30; peduncles with numerous secondary branches; clusters 2–7-flowered; leaves 4.5–11 mm wide [South America] **106. *L. ulei***
- 54:** Pedunculate clusters 1–3; secondary branches usually absent; clusters more than 5-flowered; leaves to 3.5 mm wide [outside South America]
- 55** Inflorescence with 1–3 pedunculate clusters **71. *L. nipponica***
- 55:** Inflorescence usually wholly contracted (or basal cluster remote)
- 56** Seed appendage 0.2–0.3 mm long **87. *L. ovata***
- 56:** Seed appendage 0.1 mm long
- 57** Lower bract tip acute-mucronate to acute; basal cluster usually remote [Taiwan] **67. *L. taiwaniana***

- 57:** Lower bract tip obtuse, ±swollen; basal cluster is a part of the wholly congested inflorescence [North America or Greenland] **96. *L. groenlandica***
- 46:** Tepals longer than 2.6 mm
- 58** Seed appendage c. 0.1 mm long
- 59** Outer tepals distinctly aristate [S India] **63. *L. indica***
- 59:** Outer tepals usually acute to acuminate, not aristate [outside India]
- 60** Anther/filament length ratio 2.0 (-3.0) [South America] **105. *L. ostenii***
- 60:** Anther/filament length ratio up to 1.5
- 61** Seeds 0.5–0.6 mm wide
- 62** Style 0.1–0.3 mm long
- 63** Plants with long branched ascending rhizomes; tepals with indistinct narrow margins; tepals often unequal (outer longer) [Europe] **57. *L. sudetica***
- 63:** Plants densely caespitose; rhizome short, unbranched; tepals with distinct broad margins; tepals ±equal [California] **97. *L. oreastera***
- 62:** Style 0.4–0.6 mm long
- 64** Inflorescence almost completely contracted, elongated, 2–5 cm long, often interrupted at base; basal leaves usually 5–6 mm wide; tepals castaneous-brown [E Africa] **61. *L. abyssinica***
- 64:** Inflorescence contracted, subglobose, to 1.8 cm long, compact; basal leaves usually to 3–4 mm wide; tepals dark to blackish brown [Caucasus and NE Anatolia] **64. *L. stenophylla***
- 61:** Seeds 0.7–0.8 mm wide
- 65** Inflorescence ±wholly contracted, sometimes with 1–3 pedunculate clusters; peduncles without secondary branches
- 66** Style 0.4–0.6 mm long; inflorescence elongated, 2–5 cm long [E Africa] **61. *L. abyssinica***
- 66:** Style 0.3–0.4 mm long, congested part of inflorescence to 1.5 cm long [China and Tibet] **66. *L. bomiensis***
- 65:** Inflorescence of 1–4 subsessile and 3–many pedunculate clusters (if subsessile clusters 3 or 4 then peduncles with secondary branches)
- 67** Style 0.4–0.5 mm long; tepals 2.3–3.0 mm long [Tropical Africa] **60. *L. mannii***
- 67:** Style 0.5–0.9 mm long; tepals 2.8–4.4 mm long [Hawaiian Is.] **102. *L. hawaiiensis***
- 58:** Seed appendage 0.2 mm or longer
- 68** Seeds 0.5–0.6 mm wide

JUNCACEAE (*Luzula*)

- 69** Plants with creeping-ascending branched rhizomes and stolons **65. L. abchasica**

69: Plants densely caespitose; rhizome short; stolons absent **97. L. oresteria**

68: Seeds usually 0.7–0.8 mm wide

70 Cauline leaves conspicuously broad, (4.5–) 5.0–8.0 (–12.0) mm wide

71 Seed appendage 0.1–0.2 mm long [Hawaiian Is.] **102. L. hawaiiensis**

71: Seed appendage 0.2–0.4 mm long [Beringian region] **95. L. kobayasi**

70: Cauline leaves not conspicuously broad, usually to 4 mm wide

72 Inflorescence wholly or almost completely congested

73 Style 0.3–0.4 mm long [China and Tibet] **66. L. bomiensis**

73: Style 0.6 mm or more long

74 Capsule segments usually 2.2–2.4 mm long; tepals straw-brown to brown; seeds 0.7–1.0 mm long [South Africa] **62. L. africana**

74: Capsule segments usually 2.5–2.8 mm long; tepals dark brown; seeds 1.0–1.2 mm long [European Alps] **51. L. alpina**

72: Inflorescence of mostly pedunculate clusters

75 Style usually 0.8–1.0 mm long; anther/filament length ratio usually (1.5–) 2.0 (–3.0)

76 Seed appendage 0.1–0.2 mm long [South America] **105. L. ostenii**

76: Seed appendage usually 0.3–0.4 mm long [S Europe] **54. L. taurica**

75: Style usually 0.3–0.8 mm long; anther/filament length ratio usually 1.0–2.0 **59. L. multiflora**

The species of this large Section are grouped below, for convenience, by their regions of predominant occurrence.

PREDOMINANTLY EUROPEAN SPECIES

50. *Luzula pallescens* Sw., *Summa Veg. Scand.* 13 (1814)

Juncus campestris var. *lapponicus* Retz., *Fl. Scand. Prodr.*, 2nd edn, 82 (1795); *Juncus pallescens* Wahlenb., *Fl. Lapp.* 87 (1812), *nom. illeg.*, *non* Lam. (1789); *Luzula campestris* subvar. *pallescens* (Sw.) E.Mey., *Syn. Luzul.* 18 (1823); *Luzula campestris* var. *pallescens* (Sw.) Wahlenb., *Fl. Suec.* 1: 218 (1824), *nom. illeg.*; *Luzula multiflora* var. *pallescens* (Sw.) W.D.J.Koch, *Syn. Fl. Germ. Helv.*, 2nd edn 2, 847 (1844); *Luzula erecta* var. *pallescens* (Sw.) Nolte ex Sond., *Fl. Hamburg.* 200 (1851); *Luzula campestris* subsp. *pusilla* Čelak., *Prodr. Fl. Böhmen* 1: 85 (1867); *Luzula erecta* subsp. *pallescens* (Sw.) Nym., *Consp. Fl. Eur.* 752 (1882); *Luzula sudetica* [Rasse] *pallescens* (Sw.) Asch. & Graebn., *Syn. Fl. Mitteleur.* 2(2): 519 (1904); *Luzula campestris* subsp. *pallescens* (Sw.) Čelak., *Prodr. Fl. Böhmen* 4: 749 (1881);

Juncoides pallescens (Sw.) Druce, *Bot. Soc. Exch. Club Brit. Isles* 7: 899 (1926); *Luzula multiflora* subsp. *pallescens* (Sw.) Reichg., *Fl. Neerl.* 1: 208 (1964). T: [Sweden, Lappland]; lecto: LINN449.47, designated here.

Luzula erecta var. *micrantha* Schlechtld., *Fl. Berol.* 1: 204 (1823). T: Germany, [Berlin], *D.F.L.Schlechtendal*. syn: B, destroyed; syn: HAL69172.

Luzula pallescens var. *umbrosa* Čelak., *Oesterr. Bot. Z.* 11: 312 (1861). T: [Czech Republic] Johannisbad [Jánské Lázně], *J.Kablik*; lecto: PR, designated here.

Luzula multiflora var. *minor* Bluff & Fingerh., *Comp. Fl. German.* 1: 444 (1825). T: [Germany, otherwise not indicated]

Luzula pallescens var. *umbrosa* V.I.Krecz., *Žurn. Russk. Bot. Obshch. Akad. Nauk S.S.S.R.* 12: 491 (1928). T: not designated.

Luzula pallescens var. *communis* V.I.Krecz., *Žurn. Russk. Bot. Obshch. Akad. Nauk S.S.S.R.* 12: 491 (1928). T: not designated.

Luzula pallescens var. *arenaria* V.I.Krecz., *Žurn. Russk. Bot. Obshch. Akad. Nauk S.S.S.R.* 12: 491 (1928). T: not designated.

Luzula pallescens var. *ruderalis* V.I.Krecz., *Žurn. Russk. Bot. Obshch. Akad. Nauk S.S.S.R.* 12: 491 (1928). T: not designated.

Luzula pallidula Kirschner, *Taxon* 39: 110 (1990). T: Czech Republic, Moravia, Hodonín, in silva Dúbrava, 10 Jul 1987, R.Řepka & J.Kirschner; holo: PR.

Illustrations: T.Szynal & J.Mądalski, *Atlas Fl. Polsk.* 2(2): 147 (1931); J.Kirschner, *Folia Geobot. Phytotax.* 28: 168, fig. 8 (1993).

Maps: H.Meusel, E.Jäger & E.Weinert, *Vergl. Chorol. Zentraleur. Fl.* 1: 88 (1965); E.Hultén & M.Fries, *Atlas N. Eur. Vasc. Pl.* 1: map 176 (1986); N.K.Kovtonyuk, in L.I.Malyshev & G.A.Peshkova, *Fl. Sibiri* 4 (*Araceae – Orchidaceae*): map 37 (1987) [Siberia].

Perennials, 9–15 (~30) cm tall, densely caespitose; without stolons; rhizome short; stems erect. Basal leaves densely to sparsely ciliate, 2.0–3.5 mm wide; caudine leaves usually 2 or 3, with densely papillose-serrulate margin, upper caudine leaves 3.0–5.5 cm long, 2.0–3.0 mm wide. Lower bract usually 3.0–4.0 cm long, overtopping or rarely shorter than inflorescence. Inflorescence composed of 1–2 subsessile and (5–) 7–12 (~18) pedunculate clusters; clusters ±cylindrical, 4–7 × 3–4 mm long, usually (9–) 11–14 (~20)-flowered. Peduncles straight, densely papillose, often with secondary branches, with longest peduncles (including clusters) 2.0–5.5 cm long. Bracteoles 0.8–1.2 mm long, ciliate. Tepals pale greenish to membranous to straw-brown; outer tepals conspicuously longer than inner, 2.0–2.8 mm long, subacuminate. Anthers 0.5–0.6 mm long, ±as long as c. 0.5 mm long filaments; ovary 0.5–0.6 mm long; style 0.2–0.3 mm long; stigma early deciduous, 0.6–0.7 mm long. Capsules obovoid to subglobular, equaling or shorter than perianth; capsule segments 1.6–1.9 mm long. Seeds ovoid, 0.7–0.8 mm long, 0.5–0.6 mm wide; appendage 0.2–0.3 mm long. 2n=12 [12AL], *fide* J.Kirschner, *Thaiszia* 2: 28–29 (1992). Fig. 21.

JUNCACEAE (*Luzula*)

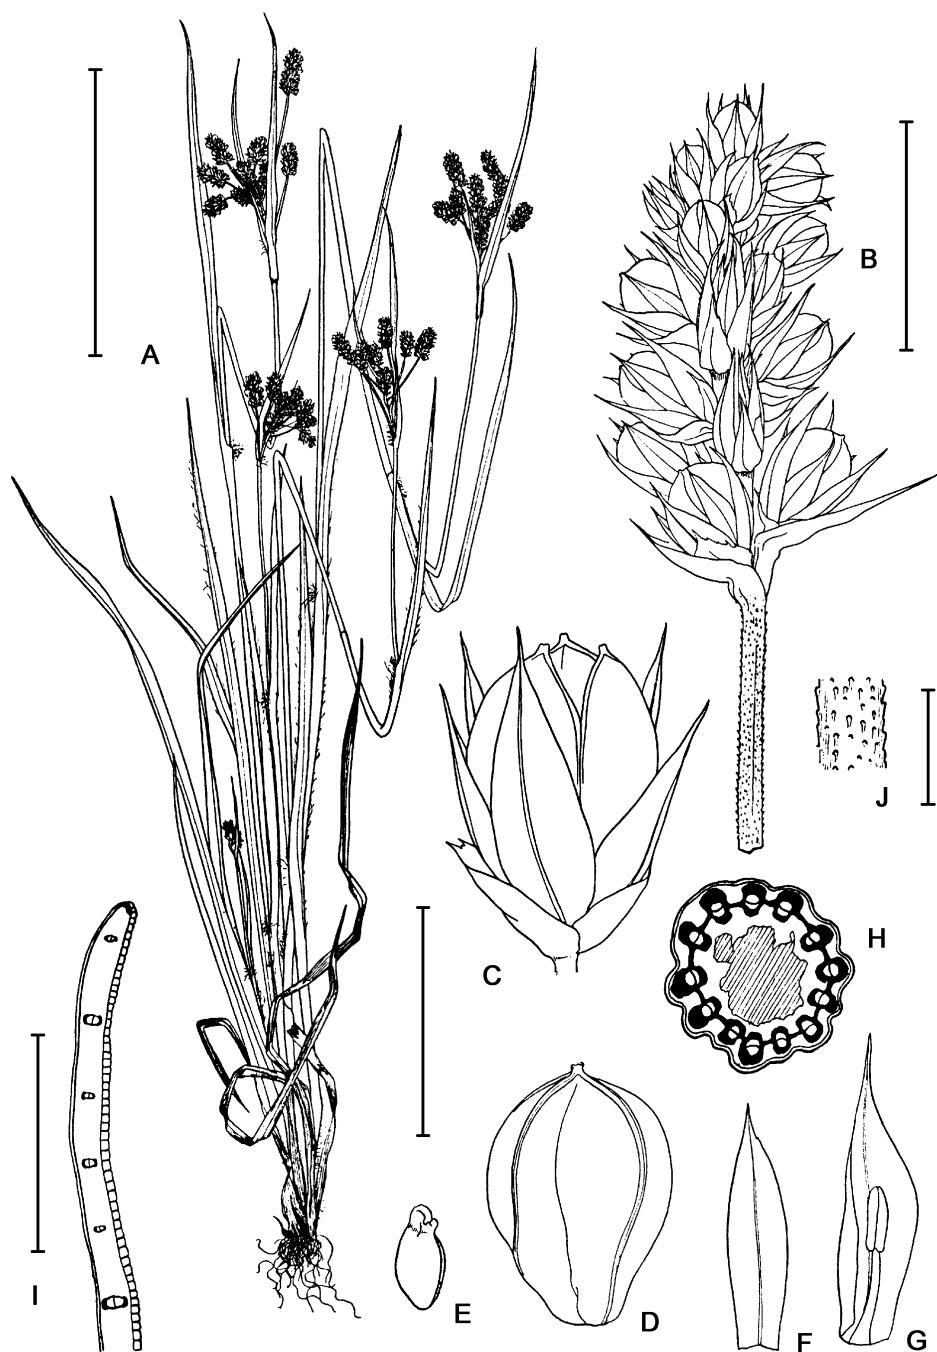

Figure 21. *Luzula pallescens*. A, habit; B, flower cluster on papillose peduncle; C, flower; D, capsule; E, seed; F, G, tepals; H, stem T.S.; I, leaf T.S.; J, detail of peduncle. (A–J, B. Błocki, 9 Jun 1891, KRA). Scale bars: A = 5 cm; B = 5 mm; C–G = 2 mm; H, I = 1 mm; J = 0.5 mm. Drawn by T.Szynal. Reproduced with permission, from T.Szynal & J.Mądalski, *Atlas Fl. Pol.* 2/2: 147 (1931).

Characterized by numerous small flowers with unequal tepals, and densely papillose peduncles (under the microscope). Sometimes confused with pale-flowered forms of *L. multiflora*.

51. *Luzula alpina* Hoppe, in J.W.Sturm, *Deutschl. Fl.* 18 (77): no. 6 (1839)

Luzula multiflora var. *alpina* (Hoppe) Willk., *Führer deut. Pfl.*, 2nd edn, 282 (1882); *Luzula sudetica* proles *alpina* (Hoppe) Asch. & Graebn., *Syn. Mitteleur. Fl.* 2(2): 518 (1904). T: Austria, Heiligenblut, D.H.Hoppe [Herb. Viv. Pl. Gram.] 108; lecto: BRNM, *fide* J.Kirschner, T.Engelskjøn & G.S.Knaben, *Preslia* 60: 98 (1988); isolecto: LI, HAL.

Luzula campestris β *latifolia* Gaudin, *Fl. Helv.* 2: 572 (1828). T: [Swiss Alps] in M. Gemmii, N.C.Seringe; holo: n.v.

Luzula multiflora var. *alpestris* Beyer, *Verh. Bot. Vereins Prov. Brandenburg.* 41: xxii (1900); *Luzula campestris* var. *alpestris* (Beyer) Vollm., *Fl. Bayern* 138 (1914), *nom. illeg.*, *non* G.Mey. (1836); *Luzula campestris* subsp. *alpestris* (Beyer) Kožuharov, *Izv. Bot. Inst. (Sofia)* 11: 132 (1963), *nom. illeg.*, *non* G.Mey. (1836) T: [numerous syntypes from the Alps, mostly B, destroyed].

Luzula campestris var. *vallesiaca* Beauverd, *Bull. Soc. Bot. Genève*, ser. 2, 10: 285 (1918). T: Switzerland, Valais, Zeneggen, c. 1330 m, *G. Beauverd*; holo: G.

Illustrations: J.Kirschner, T.Engelskjøn & G.S.Knaben, *Preslia* 60: 99, fig. 2, Plate 1, 2, 3 (1988); J.Kirschner, *Folia Geobot. Phytotax.* 28: 149, fig. 1 (1993).

Map: J.Kirschner, T.Engelskjøn & G.S.Knaben, *Preslia* 60: 104, fig. 4 (1988).

Perennials, (8–) 10–20 (35) cm tall, densely caespitose, without stolons, sparsely ciliate; stems erect, ±stout. Upper caudine leaves 4–5 cm long, 3–4 mm wide; basal leaves 3–5(–7) mm wide. Leaf margin remotely papillose-serrulate. Basal bract usually spreading, overtopping inflorescence. Inflorescence congested, composed of (3–) 5–6 (–8) sessile to subsessile (rarely some pedunculate) clusters; peduncles smooth; clusters usually of 7–10 flowers. Tepals ±lanceolate, gradually tapering to long narrow sharp pointed tips, usually dark brown; outer tepals (2.7–) 3.0–3.5 (–3.7) mm long, ±equalling the inner ones. Anthers (0.8–) 0.9–1.1 mm long, at most 1.5 times longer than the 0.5–0.8 mm long filaments. Style c. 0.6 mm long, shorter than the ovary. Capsule segments usually 2.5–2.8 mm long, shorter than the perianth, ±obovate. Seeds narrowly ovoid, 1.0–1.2 mm long, 0.7–0.8 mm wide; appendages 0.3–0.4 mm long. 2n=36 [12AL + 24BL], *fide* J.Kirschner, T.Engelskjøn & G.S.Knaben, *Preslia* 60: 100–101 (1988).

Endemic to the Alps and E Pyrenees, from Switzerland, Italy and Slovenia northwards to S Germany (Bavaria). 11: AUT, GER, SWI. 12: FRA, SPA. 13: ITA, YUC-SL. Map 82.

11: AUSTRIA: Lechtal, Elpigenalp, Bernhardseck, 2200 m, *O.Sebald* 8235 (M); Carinthia, Greifenburg, Embergeralm, 1790 m, 21 Jul 1949, *Eggler* (GZU); Carinthia, Gailtaler Alpen, N of St. Jakob, ‘Auf der Mussen’, 19 Jul 1998, *L.Kirschnerová* (PRA); Tirol, Stubaital, *D.Podlech* [*Soc. Éch. Pl. Vasc. Eur. Occid.*, no 8876] (G). GERMANY: Bavaria, Berchtesgaden, Mitterreis-Alm, *W.Lippert* 25854 & *D.Podlech* (M); Oberstdorf, Fallhorn, 1650 m, 10 Jul 1923, *Hirth* (W). SWITZERLAND: St. Gallen, Vältis, Brändlisberg, 1908, *H.Schinz* (Z). 12: SPAIN: Huesca, Torla, Ordesa, Gradas Soaso, 1850 m, *P.Montserrat* (JACA 478371). ANDORRA: Coll Blanch d’Envalira, 2500 m, 18 May 1948, *T.M.Losa* (BCF 4077). 13: ITALY: Dolomiti, Vigo di Fassa, 30 Jul 1956, *E.Werdermann* & *Meyer* (K).

Close to *Luzula multiflora* but usually with a congested dark inflorescence and broad basal leaves. In the Alps, *L. alpina* is the only member of the genus with the peculiar mixed karyotype.

52. *Luzula calabria* Ten., *Fl. Napol.* 3: 386 (1829)

Luzula multiflora var. *calabria* (Ten.) Parl., *Fl. Ital.* 2: 307 (1852); *Luzula multiflora* subsp. *calabria* (Ten.) Arcang., *Comp. Fl. Ital.* 713 (1882); *Luzula campestris* var. *calabria* (Ten.) Buchenau, *Bot. Jahrb. Syst.* 12: 163 (1890). T: [Italy, Calabria] Paludi della Sila, *Thomas*; lecto: NAP, *fide* J.Kirschner, *Folia Geobot. Phytotax.* 28: 148 (1993).

Illustrations: Migliaccio, *Giorn. Bot. Ital.* 71: 334, fig. 1, 2 (1964); S.Pignatti, *Fl. Ital.* 3: 446 (1982); J.Kirschner, *Folia Geobot. Phytotax.* 28: 151, fig. 2 (1993).

Perennials, 25–45 cm tall, densely caespitose, without stolons; rhizome short; stems erect. Basal leaves densely to sparsely ciliate, 1.7–2.2 mm wide; caudine leaves usually 1 or 2, with densely papillose-serrate margins; upper caudine leaves 5–7 cm long, 2.0–2.8 mm wide.

JUNCACEAE (*Luzula*)

Lower bract usually 2.0–4.0 cm long, shorter than inflorescence. Inflorescence with one subsessile and 1–6 pedunculate clusters; peduncles straight, smooth, usually without secondary branches; longest peduncles (including clusters) 2.0–9.5 cm long. Clusters ±cylindrical, 8–25-flowered; basal flowers of the pedunculate clusters often slightly remote. Bracteoles 1.6–1.9 mm long, ciliate or fimbriate-ciliate. Tepals pale brown; outer tepals ±equalling or slightly longer than inner ones, 2.4–2.8 mm long, subabruptly narrowing at the apex. Anthers 0.8–0.9 mm long; filaments c. 0.4 mm long; ovary 0.7–0.8 mm long; style 0.3–0.4 mm long; stigma early deciduous, 0.8–1.0 mm long. Capsules subacuminate, equalling or shorter than perianth; capsule segments 1.9–2.1 mm long. Seeds oblong-ovoid, c. 0.9 mm long, 0.6–0.7 mm wide; appendage 0.2–0.3 mm long. 2n=24 [probably 24BL], *fide* Virzo & Migliaccio, *Delpinoa* 6–7: 81 (1965).

Endemic to S Italy. 13: ITA. Grassy slopes, stream banks, meadows. Map 83.

13: ITALY: Calabria, Magna Sila, Botte Donato, c. 1800 m, 16 Aug 1909, *Cavara & Grande* 28 (BM, P); Catanzaro, Sila Piccola, from Taverna Villagio Mancusa to Butoro, c. 1200 m, 16 Jun 1979, *P.H.Davis & D.A.Sutton* (BM); Sila, W of Lorica, Sila, Mt Sorbello, c. 1850 m, 18 Jun 1979, *P.H.Davis & D.A.Sutton* (BM); Calabria, E ridge of Montenero, 1400–1600 m, *S.Snogerup & B.Snogerup* 2081 (LD).

Rare endemic distinct in having slightly loose clusters at the base of the inflorescence; in general habit it is similar to *L. pallescens*.

53. *Luzula fallax* Kirschner, *Preslia* 63: 84 (1991)

T: N Greece, Mt. Pangeon, 1800–1850 m. *S.Snogerup & A.Strid* 4934, cult. no. L134; holo: PR, iso: LD, PR.

Illustration: J.Kirschner, *Preslia* 63: 85, fig. 1 (1991).

Perennials usually 15–20 cm tall, densely caespitose; stolons absent; rhizome short; stems erect, slender. Basal leaves densely to sparsely ciliate, 2–4 mm wide. Cauline leaves usually 2, with densely papillose-serrate margin; upper cauline leaves 1.5–4.5 cm long, 2.0–3.0 mm wide. Lower bract usually 1.2–2.5 cm long, shorter than inflorescence. Inflorescence composed of 1–2 subsessile and 2–5 pedunculate clusters; peduncles straight or flexuose, papillose in upper half or papillose throughout, usually without secondary branches; longest peduncles (including clusters) 2.0–5.5 cm long. Clusters ovoid to hemispherical, 4.5–7.5 × 5.0–6.5 mm, usually (2–) 4–6 (–8)-flowered; basal flowers of the pedunculate clusters not remote. Bracteoles 1.0–1.5 mm long, ciliate above. Tepals pale to dark brown; outer tepals ±equalling inner ones, 2.6–3.0 mm long. Stamens 6; anthers (0.5–) 0.7–0.9 mm long; filaments 0.4–0.6 mm long; ovary 0.7–0.8 mm long; style 0.7–1.0 mm long; stigma 1.7–2.2 mm long. Capsules obovoid to subglobular, equalling or shorter than perianth; capsule segments brown, 2.0–2.4 mm long, c. 1.3 mm wide. Seeds ovoid, (0.9–)1.0 mm long, 0.7–0.8 mm wide; appendage c. 0.3 mm long. 2n=24 [24BL], *fide* J.Kirschner, *Preslia* 63: 86 (1991).

Balkan Peninsula from Bulgaria to European Turkey. 13: ALB, BUL, GRC, TUE. Slopes of hills and lower mountains and meadows on naturally or artificially disturbed acid soils. Map 84.

13: ALBANIA: Kiri near Skutari, *I.Dörfler* 43 (LD). BULGARIA: Pirin [Mtns], Melnik, slopes above Rozhen, Vlashka Put, *J.Kirschner & B.Kuzmanov* L116 (PRA); Sofia, Lyulin Planina, 22 Jun 1919, *Akhtaroff* (SOM). GREECE: Mt Pangeon, 0.5 km E of summit, *S.Snogerup & A.Strid* 4934 (LD). TURKEY-in-EUROPE: Istanbul, Silivri, Sinekli, *Delice & Bulut* (LD, ISTF 30535).

Characterized by small, few-flowered, usually hemispherical clusters, papillose peduncles and relatively short seed appendages. Plants from E Bulgaria and the Sofia vicinity are ±variable in the diagnostic characters, perhaps due to hybridization. In the S Pirin Mtns, introgression with *L. campestris* subsp. *campestris* was observed (J.Kirschner, *Preslia* 63: 81–112, 1991). The distribution is imperfectly known.

Luzula campestris var. *atrofusca* Maly, *Glasn. Zemaljsk. Muz. Bosni Hercegovini* 32: 141 (1920). T: Bosnia, Sarajevo, Mt Gola Jahorina, K.Maly; syn: SARA.

Perennials, usually 15–25 cm tall, densely or rarely loosely caespitose; rhizome short, without stolons. Basal leaves usually up to 8–10 cm long, (2.5–) 3.0–4.0 (–5.0) mm wide; caudine leaves 1–2, usually 2.5–4.0 cm long, 2–3 mm wide; all leaves with obtuse tip and densely papillose-serrulate margins. Inflorescence composed of 1 (–3) subsessile and 2–6 (–7) pedunculate ovoid to hemispherical (5–) 7–9 (–11)-flowered clusters; peduncles straight, rarely slightly flexuose, ±smooth, without secondary branches; longest peduncles up to 2–4 cm long. Lower bract usually 1–3 cm long, shorter than inflorescence. Bracteoles membranous, 1.5–2.5 mm long, ovate, fimbriate-ciliate above. Tepals ±equal, entire, acuminate, usually 2.9–3.5 mm long, dark to blackish brown, with indistinct paler brownish margins. Stamens 6; anthers (0.8–) 1.1–1.3 (–1.4) mm long; filaments c. 0.5–0.6 mm long; style 0.7–1.1 mm long; stigmas 1.8–3.0 mm long, subpersistent. Capsule ±obovoid, ±shorter than perianth, pale brown to dark brown; capsule segments 2.4–3.0 mm long. Seeds 1.0–1.2 mm long, 0.7–0.8 mm wide; appendage (0.2–) 0.3–0.4 (–0.5) mm long. 2n=12 [12AL], *fide* J.Kirschner, *Thaiszia* 2: 30–31 (1992). Fig. 22.

Numerous literature records under the name *L. campestris* from outside Europe mostly refer to other species in the sect. *Luzula*. In Spain and Portugal, subsp. *campestris* is rather variable, particularly in the flower size, inflorescence appearance and length of stolons; in other regions, the variation is very limited.

56b. *Luzula campestris* subsp. *nevadensis* P.Monts., *Anales Inst. Bot. Cavanilles* 21(2): 492 (1964)

T: Spain, Sierra Nevada, Puerto Lobo, 2100 m, 14 Jul 1923, *P.Font Quer*; holo: BC150865.

Map: P.Montserrat, *Anales Inst. Bot. Cavanilles* 21(2): map 8 (1964).

Perennial, usually 20–32 cm tall; rhizome long, creeping; stolons present. Basal leaves sparsely ciliate, c. 3.0–4.5 mm wide; caudine leaves 2–3, with upper ones 3.5–5.0 cm long, 2.0–2.8 mm wide. Lower bract usually 1.2–2.0 cm long, shorter than inflorescence. Clusters

5–8-flowered; peduncles straight. Bracteoles 2.4–3.0 mm long. Tepals 3.5–4.2 mm long, brown to dark brown. Anthers 1.4–1.8 mm long; filaments 0.4–0.5 mm long; ovary 1.2 mm long; style 1.4–2.2 mm long; stigmas 2–3 mm long, subpersistent. Capsule segments 2.8–3.2 mm long. Seeds oblong-ovoid, 1.1–1.2 mm long, c. 0.9 mm wide; appendage 0.5–0.6 mm long. Mean length of middle stomata in upper cauline leaves 44–45 µm. Polyploid, *fide* J.Kirschner, *Pl. Syst. Evol.* 200: 5 (1996).

Endemic to Spain. 12: SPA. Mountain grasslands and open woodlands. Map 88.

12. SPAIN: Barcelona, Vallgorguina, ‘ad Torrentem Can Gras’, 250 m, *P. Monserrat* (JACA2347).

An imperfectly known taxon, presumed to be a polyploid derivative of subsp. *campestris*. In addition to the holotype gathering, only a single additional specimen is known. However, its location, rather far from Sierra Nevada and in a different ecological situation, raises some doubts about its identity.

Map: E.Hultén & M.Fries, *Atlas N. Eur. Vasc. Pl.* 1: map 175 (1986).

Perennials, 10–25 (–35) cm tall, loosely caespitose; rhizome ascending to oblique, branched; stolons absent. Basal leaves sparsely ciliate, 1.5–4.0 mm wide; caudine leaves 2–3; upper leaves 4.5–6.0 cm long, 1.4–3.0 mm wide; all leaves with densely papillose-serrate margin and apex obtuse. Lower bract usually 1.5–3.5 cm long, overtopping inflorescence. Inflorescence usually partly congested, of 3–10 ellipsoidal to ovoid clusters; clusters (5–) 7–11 (–15)-flowered, with some or most clusters pedunculate; peduncles straight, smooth, usually without secondary branches, up to 1.0–3.5 cm long. Bracteoles 1.2–1.5 mm long, ciliate. Tepals unequal to ±equal, ±lanceolate, blackish brown, narrowly paler bordered above; outer tepals (1.9–) 2.1–2.5 (–2.7) mm long. Stamens 6; anthers (0.4–) 0.5–0.7 (–0.8) mm long; filaments 0.4–0.5 mm long; ovary 0.8–1.0 mm long; style 0.1–0.3 mm long; stigma early deciduous, 0.8–1.4 mm long. Capsules narrowly obovoid, subacute, indistinctly mucronate, equalling or shorter than perianth; capsule segments 1.7–2.0 × c. 1.0 mm. Seeds narrowly ellipsoidal, 0.9–1.0 mm long, 0.5–0.6 mm wide; appendage c. 0.1 mm long, fibrillate. 2n=48 [48CL], *fide* J.Kirschner, *Thaiszia*, *J. Towards the south, most plants have inner and outer tepals ±of the same length, otherwise the variation limits are narrow. The loosely caespitose growth with oblique/ascending branched rhizome is an important diagnostic character.

Map: E.Hultén, *Kongl. Svenska Vetenskapsakad. Handl.*, ser. 5, 8(5): map 64 (1962).

Perennials, ±densely caespitose; rhizome short; stolons absent. Basal leaves densely ciliate to subglabrous, 2.5–4.0 (–6.0) mm wide; caudine leaves 1–3 (–4), with densely papillose-serrulate margins. Lower bract leaf-like, usually longer than or equaling inflorescence (less often shorter). Inflorescence usually composed of pedunculate clusters, or less often clusters subcongested; peduncles smooth or papillose. Bracteoles scarious, to 2 mm long, subentire to ciliate-fimbriate. Tepals ±equal to subequal, acuminate to subaristate, 2.4–3.5 (–3.9) mm long, straw, straw-brown, castaneous-brown to dark brown, rarely blackish, usually with a distinct paler margin. Stamens 6; anthers usually 0.6–1.0 (–1.4) mm long, anther/filament ratio usually 1.0–1.5 (–2.5); style 0.3–0.7 (–0.8) mm long; stigmas early deciduous, 1.1–2.0 (–3.1) mm long. Capsule obovoid, smooth, shorter to slightly longer than perianth, pale brownish to dark brown; capsule segments 1.9–2.8 mm long. Seeds oblong-ovoid to ellipsoid-ovoid, 0.8–1.2 mm long, 0.6–0.9 mm wide; appendage 0.2–0.4 (–0.5) mm long.

An extremely widespread and variable polyploid, rarely (partially) agmatoploid, species. In some regions (China, USA, the Far East) it is not known satisfactorily, and additional taxa may be revealed. Six subspecies are recognized.

- | | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| 1 Peduncles ±densely papillose throughout | 59d. subsp. snogerupii |
| 1: Peduncles smooth, rarely with scattered papillae just below clusters | |
| 2 Peduncles sometimes (usually one or more in a plant) recurved | 59e. subsp. hibernica |
| 2: Peduncles straight to (rarely) flexuose, not recurved | |
| 3 Seeds (excluding appendage) (0.8–) 0.9 mm long; tepals to 2.7 mm long; capsule often longer than perianth; seed appendage (0.3–) 0.4 mm long | 59f. subsp. monticola |
| 3: Seeds (0.9–) 1.0–1.1 (–1.2) mm long; tepals usually longer than 2.7 mm, or if tepals to 2.7 mm long and capsule exceeding perianth, then seed appendage 0.2–0.3 mm long | |

- 4 Capsule sub acuminate, usually distinctly exceeding perianth; style 0.3–0.5 mm long **59b.** subsp. **frigida**
- 4: Capsule sub obtuse, usually shorter than perianth; style (0.4–) 0.5–0.8 mm long
- 5 Seed appendage c. 0.3 mm long; capsule segments 1.9–2.2 mm long **59c.** subsp. **sibirica**
- 5: Seed appendage usually 0.4 mm long; capsule segments (2.0–) 2.3–2.6 (–2.8) mm long **59a.** subsp. **multiflora**

Map: E.Hultén, *Kongl. Svenska Vetenskapsakad. Handl.*, ser. 5, 8(5): map 64 (1962).

Stems 15–38 cm tall. Basal leaves densely to sparsely ciliate, 3–6 mm wide; caudine leaves usually 2–4, 3.7–12 cm long, 1.8–5 mm wide. Lower bract usually 2.5–6.5 cm long, exceeding inflorescence or shorter. Inflorescence usually of (4–) 5–12 (–17) pedunculate clusters; clusters ellipsoid to ovoid, usually (6–) 8–14 (–18)-flowered; peduncles to 1.5–5.2 cm long, straight, ±smooth, rarely with secondary branches. Bracteoles 1.5–2.5 mm long, subtire. Tepals pale yellowish-greenish to dark brown, 2.5 to 3.9 mm long. Anthers 0.7–1.4 mm long, anther/filament length ratio 1.0–2.0 (–2.5); style 0.4–0.8 mm long; stigma

JUNCACEAE (*Luzula*)

1.3–3.1 mm long. Capsule obovoid to subglobular, equalling perianth or shorter; capsule segments (2.0–) 2.2–2.6 (–2.8) mm long. Seeds ovoid to ellipsoid, 0.9–1.2 mm long, (0.6–) 0.7–0.8 (–0.9) mm wide; appendage 0.3–0.4 (–0.5) mm long. 2n=24 [24AL], 36 [36AL], *fide* J.Kirschner, *Thaiszia* 2: 23–27 (1992). Fig. 22, 24.

An extremely variable subspecies occurring very frequently in innumerable forms in most of Europe, many regions of West Asia, in North America (partly introduced), and introduced in a number of regions (more frequently in Australia, New Zealand, rarely in many additional regions). Many literature records refer to other taxa (particularly from W North America, SE Asia etc.). Only regions where the occurrence was safely confirmed on the basis of good herbarium material are listed here. It is difficult to distinguish the secondary occurrence from native distribution. 10: DEN, FIN, FOR, GRB, ICE, IRE, NOR, SWE. 11: ALL. 12: COR, FRA, POR, SPA. 13: ALB, BUL, GRC, ITA, ROM, TUE, YUC. 14: ALL. 20: ALG, MOR. 21: azo, cny, mdr. 30: WSB. 31: KHA, SAK. 32: KAZ, KGZ, TKM, TZK, UZB. 33: NCS, TCS. 34: IRN, TUR. 36: CHC, CHT. 38: JAP, KOR, tai. 40: WHM, EHM. 50: tas. 51: nzn, nzs. 70: GNL. 71: ABT, BRC, MAN. 72: LAB, NBR, NFL, NSC, ONT, PEI, QUE. 73: MNT, ORE. 74: IOW, MIN, NDA, SDA. 75: CNT,INI, MAI, MAS, MIC, NWH, NWJ, NWY, OHI, PEN, VER, WVA. 78: DEL, VRG. 80: COS. 85: AGE. 90: FAL. In a variety of habitats, most often in meadows (usually wet) and montane to subalpine grasslands, open woodlands, usually disturbed, road verges etc. from sea level to subalpine altitudes. Map 91 (primary and secondary distributions not distinguished on the map).

59b. *Luzula multiflora* subsp. *frigida* (Buchen.) V.I.Krecz., Žurn. Russk. Bot. Obshch. Akad. Nauk S.S.R. 12: 490 (1928)

Luzula campestris var. *frigida* Buchenau, *Oesterr. Bot. Z.* 48: 184 (1898); *Luzula frigida* (Buchenau) Sam., in C.A.M.Lindman, *Sv. Fanerogamfl.* 161 (1918); *Luzula sudetica* var. *frigida* (Buchenau) Fernald, *Rhodora* 47: 265 (1945); *Luzula kjellmaniana* subsp. *frigida* (Buchenau) Schljakov, *Novosti Sist. Vyssh. Rast.* 16: 85 (1979). T: Norway, Kongsvold, Dovre Fjeld, Drivathal, 3 Aug 1892, *K.G.Baenitz* [*Herb. Eur.*] 7120; lecto: PR, *fide* J.Kirschner, *Taxon* 39: 113 (1990); isolecto: W.

Luzula multiflora var. *contracta* Böcher, *Meddel. Grönland* 147(7): 17 (1950), nom. inval. [interpreted according to authentic material in C]

Illustrations: J.Lid, *Norsk & Svensk Fl.* 199, fig. 98f, 203, fig. 100g (1963).

Maps: E.Hultén, *Kongl. Svenska Vetenskapsakad. Handl.*, ser. 5, 8(5): map 64 (1962); E.Hultén & M.Fries, *Atlas N. Eur. Vasc. Pl.* 1: map 173 (1986).

Stems 13–30 cm tall. Basal leaves sparsely ciliate or subglabrous, 2.0–3.5 mm wide; caudine leaves usually 1–3, with upper ones 2.0–4.5 cm long and 1.0–2.8 mm wide. Lower bract usually 1.0–2.5 cm long. Inflorescence congested, of 2–6 clusters; clusters ellipsoid–ovoid or ovoid, 6–10-flowered, mostly pedunculate. Peduncles straight, smooth, rarely with secondary branches, to 0.8–2.5 cm long. Bracteoles 1.2–1.6 mm long, ciliate. Tepals dark brown, 2.4–2.9 mm long. Anthers 0.6–0.9 mm long, anther/filament length ratio 0.8–1.2; ovary 0.8–0.9 mm long; style 0.3–0.5 mm long; stigma 1.2–1.3 mm long. Capsules subacuminate, equalling or overtopping the perianth; capsule segments 2.0–2.4 mm long. Seeds ±ellipsoid, 1.0–1.1 mm long, 0.7 mm wide; appendage 0.2–0.3 mm long. 2n=36 [36AL], *fide* J.Kirschner, *Thaiszia* 2: 27 (1992).

Northern Europe, Iceland, Greenland, distribution in North America imperfectly known, but certainly from Alaska and Canada, and probably also in the mountains of NE USA. Very similar plants from the Far East require further investigation. 10: FIN, ICE, NOR, SWE. 14:

Populations from Kamchatka and the Kuriles have an intermediate appearance between subsp. *frigida* and subsp. *sibirica*. In addition, plants close to the type subspecies are found in the southern part of the range of subsp. *sibirica*.

59d. *Luzula multiflora* subsp. *snogerupii* Kirschner, *Ann. Bot. Fenn.* 29: 239 (1992)

T: Greece, Nom. Serrai, Mt Vrondous, 2 km SW of the summit, 1250–1300 m, 14 Jul 1987, *S.Snogerup*, cultivated as L132; holo: PR; iso: LD, PRA.

Plants 10–32 cm tall. Basal leaves sparsely ciliate, 2.5–4.0 mm wide; caudine leaves usually 2 or 3, with upper ones 3.0–6.5 cm long and 2.0–3.5 mm wide. Lower bract usually 2.0–3.0 cm long, overtopping inflorescence. Inflorescence composed of one subsessile and 6–13 ellipsoid-ovoid to ovoid-hemispherical 6–12-flowered pedunculate clusters. Peduncles straight, 2.0–3.5 cm long, densely papillose, often with secondary branches. Bractlets 1.2–1.7 mm long, subentire. Tepals pale straw-brown, 2.4–3.1 mm long. Anthers 0.5–0.8 mm long, anther/filament length ratio 1.0–1.6; ovary 0.8–1.0 mm long; style 0.3–0.4 mm long; stigma 1.1–1.5 mm long. Capsule obovoid to subglobular, equalling perianth or shorter; capsule segments 1.9–2.1 mm long. Seeds ovoid to subglobular, 0.9–1.0 mm long, 0.75–0.8 mm wide; appendage 0.4 mm long. 2n=36 [12AL+24BL], *fide* J.Kirschner, *Ann. Bot. Fenn.* 29: 238, 240 (1992).

Known from Bulgaria and Greece. 13: BUL, GRC. Grassy mountain slopes, above 1000 m. Map 94.

13. BULGARIA: Sofia, Gorni Lozen, 950–1050 m, 29 May 1988, *J.Kirschner* L110 (PRA); Sofia, Gorni Lozen, 950–1050 m, 17 Jun 1991, *J.Kirschner* L512, L513, L524 (PRA). GREECE: Serrai, Mt Vrondous, *S.Snogerup* 5052 (LD).

59e. *Luzula multiflora* subsp. *hibernica* Kirschner & T.C.G.Rich, *Watsonia* 21: 92 (1996)

T: Ireland, Mayo (Vice county H27, West Mayo), Cluddnaun (grid reference G/018.285), Jul 1989, *T.C.G. Rich* L254; holo: PR; iso: BEL, BM, DBN, E, K, LD, PRA, TCD.

Illustration: J.Kirschner & T.C.G.Rich, *Watsonia* 21: 93, fig. 2 (1996)

Stems 12–27 (–35) cm tall, usually slender. Basal leaves ±densely to subsparsely ciliate, 2.2–2.8 (–3.5) mm wide. Cauline leaves usually 2–3. Upper caudine leaves 4.0–8.5 cm long, 1.5–2.2 (–2.5) mm wide. Lower bract usually 1.7–4.3 (–5.5) cm long, shorter than or overtopping inflorescence, often reddish. Inflorescence with pedunculate clusters; peduncles mostly straight, some flexuous, usually at least one in a plant recurved, sometimes with secondary branches, smooth. Clusters 5–9 (–18); subsessile clusters 1–2, ellipsoidal-ovoid to ovoid, rarely hemispherical; flowers in pedunculate clusters 5–8 (–10); bractlets 1.5–1.8 mm long, ciliate. Tepals pale straw-brown or brown; outer sepals ±equalling inner ones or often up to 0.4–0.6 mm longer, 2.6–3.2 mm long, acuminate. Anthers 0.6–0.7 mm long, with anther-filament length ratio 1.0–1.2; ovary 0.9–1.0 mm long; style 0.6–0.7 mm long; stigma 1.2–1.4 mm long. Capsules equalling perianth or shorter; capsule segments 1.9–2.2 mm long; seeds ovoid, 0.8–0.9 (–1.0) mm long, 0.7 mm wide; appendage 0.2–0.3 mm long. 2n=24 [24AL], *fide* J.Kirschner, *Folia Geobot. Phytotax.* 30: 392 (1995). Fig. 25.

Probably endemic in Ireland; in the west probably the only subspecies of *L. multiflora*. 10: IRE. Mesotrophic grasslands along streams, track and road verges, wood clearings, usually at low altitudes. Map 95.

10. IRELAND: North Kerry, Ross Castle, *J.Kirschner, T.C.G.Rich & G.Kay* (PRA); West Galway, Connemara, Kilmeelickin, *J.Kirschner, T.C.G.Rich & G.Kay* (PRA); West Mayo, Ballingen, Keerglen R., *J.Kirschner, T.C.G.Rich & G.Kay* (PRA); Kerry, Killarney, Upper Lake, *B.Welch* 295 (UPS).

JUNCACEAE (*Luzula*)

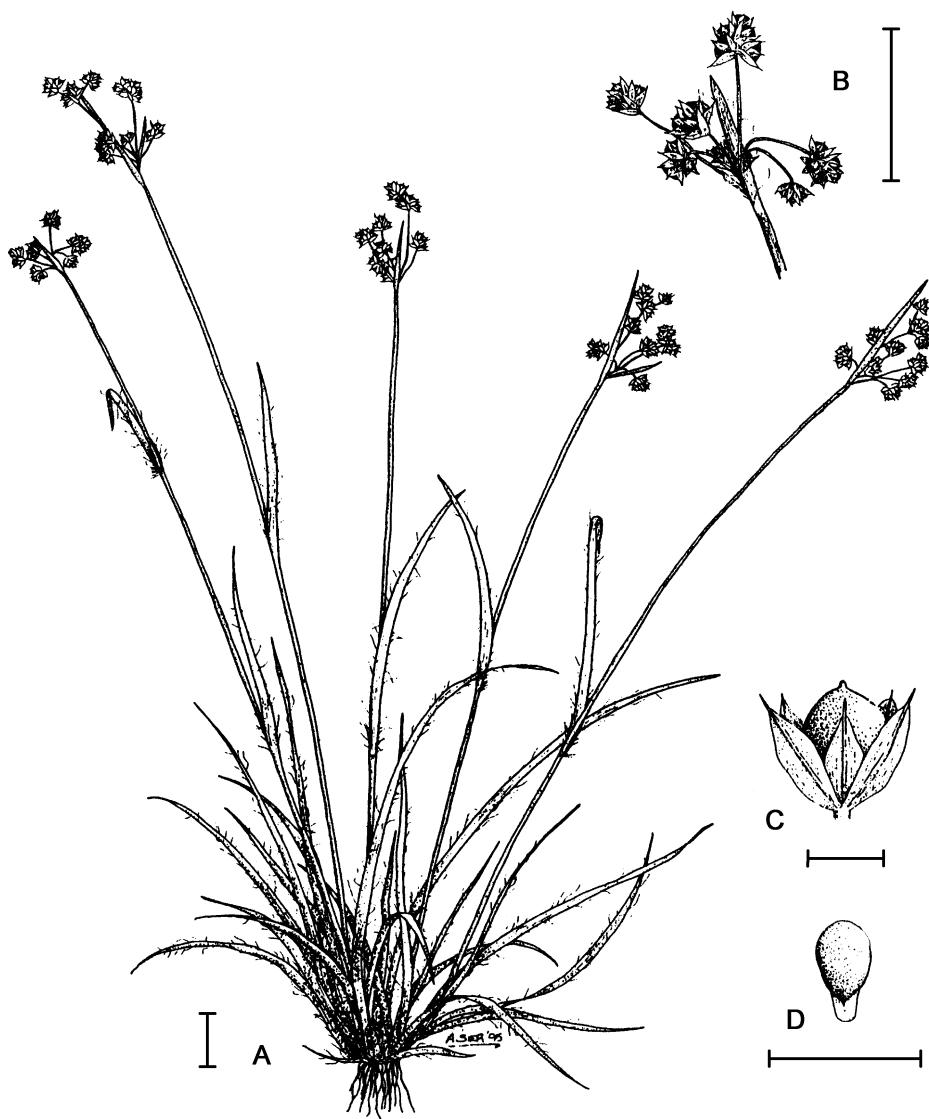

Figure 25. *Luzula multiflora* subsp. *hibernica*. A, habit; B, inflorescence; C, perianth and capsule; D, seed. (A–D, J.Kirschner & T.C.G.Rich L254, BM, PR). Scale bars: A, B = 1 cm; C, D = 1 mm. Drawn by A.Sier. Reproduced from Kirschner & Rich, *Watsonia* 21: 92, fig. 2 (1996).

There is evidence pointing to an allopolloid origin of subsp. *hibernica* following hybridisation between *L. pallescens* and *L. campestris*; see J.Kirschner, *Folia Geobot. Phytotax.* 30: 283–290 (1995).

59f. *Luzula multiflora* subsp. *monticola* Kirschner, *Pl. Syst. Evol.* 200: 6 (1996)

T: Spain, Huesca, Bisaurri, de la Fuente de la Muria a la Fabosa de la Muria, 1370–1540 m, 5 Jul 1988, Sesé et al., cultivated as L305; holo: PR; iso: PRA, JACA.

Plants 13–26 cm tall. Basal leaves sparsely ciliate, 2–6 mm wide; caudine leaves 1 or 2, 3.5–7.0 cm long, 2–3 mm wide. Lower bract c. 2.5–4.2 cm long, usually longer than inflorescence. Inflorescence composed of 3–8 usually short-peduncled narrowly ovoid c. 6–9-flowered clusters, at least partly subcongested. Peduncles ±straight, smooth, usually to 3.5 cm long (rarely to 8 cm). Tepals straw-brown to pale brown, (2.5–) 2.6–2.7 (–2.8) mm long. Anthers 0.6–0.7 mm long, anther/filament length ratio 1.2–1.4; ovary 0.7–0.8 mm long; style 0.3–0.4 mm long; stigmas 1.1–1.4 mm long. Capsule obovoid to subglobose, equalling to exceeding perianth; capsule segments 2.1–2.6 mm long. Seeds (0.8–) 0.9 mm long, (0.6–) 0.7 mm wide; appendage (0.3–) 0.4 mm long. 2n=24 [24BL], *fide* J.Kirschner, *Pl. Syst. Evol.* 200: 7 (1996).

Known from the southern part of the Pyrenees in Spain. 12: SPA. Wet grasslands in the mountains. Map 96.

12. SPAIN: Lérida, Sorpe, Puerto de la Bonaigua, 5 Aug 1986, *P.Montserrat & L.Villar* (JACA, PRA).

Hybrids

Luzula alpina Hoppe × *L. multiflora* (Ehrh.) Lej.

A hybrid, sterile plant between a partially agmatoploid and a tetraploid parent (2n=28=20AL+8BL) was observed and collected in Austria [Hohe Tauern, Grossglockner, 15 Jun 1953, *M.Palm*, cultivated by *H.Nordenskiöld HI-1* (UPS)], and studied by *H.Nordenskiöld* (unpubl.).

Luzula ×danica H.Nordensk. & Kirschner, *Preslia* 63: 109 (1991) = *Luzula congesta* (Thuill.) Lej. × *L. multiflora* (Ehrh.) Lej.

T: Denmark, between Gram and Ribe, *H.Nordenskiöld MT-3*, holo: UPS.

A hybrid known from Great Britain, Denmark and Sweden; seldom among parental plants. Fertile.

Luzula campestris (L.) DC. × *L. pallescens* Sw.

Hybrid plants rarely found between parents, up until now observed in Sweden only. Probably fertile.

Luzula ×bogdanii Kirschner, *Preslia* 63: 105 (1991) = *Luzula campestris* (L.) DC. × *L. fallax* Kirschner

T: Bulgaria, the Pirin Mtns, Rozhen, Vlashkija Put, *J.Kirschner L117*; holo: PR; iso: LD, PRA.

At the places of contact between the parental species, the hybrid may form large populations. Up to now known from S Bulgaria. It is almost normally fertile and includes a number of hybrid karyotypes with mixed AL and BL chromosomes.

Luzula ×media Kirschner, *Preslia* 63: 107 (1991) = *Luzula divulgata* Kirschner × *L. multiflora* (Ehrh.) Lej.

T: [Czech Republic] Bohemia, Rakovník, Nový Mlýn, silva Brabečka, 16 Jun 1987, *J.Hašková, J.Kirschner & F.Krahulec*; holo: PR; iso: PRA

JUNCACEAE (*Luzula*)

Found once between parents in the Czech Republic; documented karyologically [see J.Kirschner, *Preslia* 63: 107 (1991)]. At least partially fertile.

Luzula ×heddae Kirschner, *Preslia* 63: 93 (1991) = *Luzula campestris* (L.) DC. × *L. sudetica* (Willd.) Schult.

T: [Czech Republic] Bohemia, Hlinsko, Rváčov, 9 Jul 1990, L.Kirschnerová & J.Kirschner; holo: PR; iso: PRA.

Found occasionally at the contact of parental species. Known from Sweden, Czech Republic, Switzerland and Spain, e.g., Sweden, Västmanland, Ramsberg, 29 Jun 1935, G.Samuelsson (LD); Dalsland, Edsleskog, 12 Jun 1918, G.Samuelsson (LD). A totally seed-sterile hybrid.

Luzula ×hybrida H.Lindb. ex Kirschner, *Preslia* 63: 93 (1991) = *Luzula pallescens* Sw. × *L. sudetica* (Willd.) Schult.

T: Finland, Savonia borealis, Jorois [Joroinen], Lapinmäki, 2 Jul 1904, H.Lindberg; holo: LD; iso: [Pl. Finl. Exs.J 158, e.g. BP, H, K, P, PRC, S

A rare, sterile hybrid known from the Czech Republic, Sweden, Finland and N Russia, e.g., Sweden, Torne Lappmark, Vittangi, 28 Jul 1929, O.Holmberg (LD); Finland, Posio, Keski-Posio, Salmela, 4 Jul 1949, G.Marklund (H, LD).

T: Tian Shan [Mtns], otherwise not designated.

Luzula multiflora subsp. *incrassata* V.I.Krecz., Žurn. Russk. Bot. Obshch. Akad. Nauk S.S.S.R. 12: 490 (1928).

T: Sakhalin, Okhotsk region, Kamchatka [otherwise not designated].

Luzula multiflora var. *gracilis* Buchenau ex V.I.Krecz., Žurn. Russk. Bot. Obshch. Akad. Nauk S.S.S.R. 12: 490 (1928).

T: Russian Far East, Ayan, Avacha R. basin [not located at LE].

Doubtful Hybrid

Luzula ×winderiae Murr, Magyar Bot. Lapok 28: 67 (1930).

T: [Austria] Vorarlberg, supra lacum Spullersee montis Arlberg, c. 1900 m, 7 Aug 1916, J.Murr; holo: n.v.

The name was reported to belong to a hybrid between *L. multiflora* var. *alpestris* [=*L. alpina*] and *L. spicata*. The existence of the hybrid is very doubtful.

PREDOMINANTLY AFRICAN SPECIES

60. *Luzulamannii* (Buchenau) Kirschner & Cheek, Kew Bull. 55: 900 (2000)

Luzula campestris var. *mannii* Buchenau, Bot. Jahrb. Syst. 12: 159 (1890); *Luzula campestris* subsp. *mannii* (Buchenau) Weim., Svensk Bot. Tidskr. 40: 173 (1946); isonyms: Sóó, Acta Bot. Acad. Sci. Hung. 16: 367 (1971); Fern.Casas, Fontqueria 33: 41 (1992). T: [Cameroon] Kamerun-Gebirge, 10000–13500 ft, Mann 2108; lecto: K; iso (fragment): W; Fernando Po, 8500', Mann 658, 1467; para K; Cameroons, H.H.Johnston 48 [the latter erroneously cited as Mann 48 by F.G.P.Buchenau]; para: K.

Perennials 25–60 cm tall; rhizome horizontal or ascending; stolons short, ascending. Leaves with obtuse tip and densely papillose-serrulate margins, hairy to densely hairy. Lower bract leaf-like, usually shorter than inflorescence. Inflorescence of mostly pedunculate clusters. Peduncles smooth, usually with short secondary branches. Capsule shorter than perianth. Seeds ovoid-subglobular, 0.6–0.8 mm wide; appendage almost invisible, less than 0.1 mm, hyaline.

A rare endemic with three disjunct populations in tropical Africa (Equatorial Guinea, Cameroon and the Uganda/Kenya border). Two subspecies are recognized.

Anther/filament length ratio c. 1.5; peduncles ±straight and rigid, 0.3–0.5 mm in diam.; tepals blackish castaneous brown

60a. subsp. *mannii*

Anther/filament length ratio 0.3–0.6; peduncles flexuose to arcuate, 0.2–0.3 mm in diam.; tepals pale castaneous brown to dark brown, usually with a narrow pale margin and often with a pale yellowish-stramineous middle part

60b. subsp. *gracilis*

60a. *Luzulamannii* (Buchenau) Kirschner & Cheek subsp. *mannii*

Plants 25–60 cm tall. Basal leaves usually 7–9 (–13) cm long, (4–) 5–6 (–8) mm wide; caudine leaves 2–3, usually 3.5–7.0 cm long and 2.5–4.5 mm wide. Stem rigid, erect, c. 1.7 mm in diam. Lower bract 2.0–6.5 cm long. Inflorescence composed of 3–4 ±sessile and 2–7 pedunculate clusters; peduncles usually with secondary branches and 1–3 sessile clusters on each branch; peduncles straight, rigid, erect and patent (very rarely one of them ±nodding), 0.3–0.5 mm in diam., 2–3 (rarely up to 11) cm long; clusters ±echinate, ±globular, 0.6–0.9 (–1.2) cm in diam., usually with more than 13 flowers. Bracteoles long acuminate, membranous, often with cupreous middle part, up to 3 mm long, equalling perianth or shorter, densely ciliate. Tepals long acuminate, blackish castaneous brown, subequal, sometimes one or two outermost ones distinctly longer than inner ones, 2.6–3.0 mm long. Anthers usually 0.8–1.2 mm long; filaments 0.5–0.9 mm long; style 0.5 mm long; stigmas 1.5–1.8 mm long. Capsule ±globular, rounded above with an indistinct mucro; capsule segments 1.8–2.0 mm long and c. 1.5 mm wide, dark brown. Seeds 0.9–1.1 mm long, 0.7–0.8 mm wide. 2n=42, *fide* J.K.Morton, Opera Bot. 121: 159–172 (1993), n.v. Fig. 26.

JUNCACEAE (*Luzula*)

60b. *Luzulamannii* subsp. *gracilis* (S.Carter) Kirschner & Cheek, *Kew Bull.* 55: 901 (2000)

Luzula campestris var. *gracilis* S.Carter, *Kew Bull.* 17: 179 (1963). T: Uganda, Mbale District, Mt Elgon, Jan 1918, *Drummer 3545*; holo: K; iso: BM, NBG, P.

Illustration: S.Carter, in *Fl. Trop. E. Afr., Juncaceae* 9, fig. 2 (1966).

Plants up to 65 cm tall. Basal leaves usually 6–15 cm long, 3–4 mm wide; caudine leaves 3–4, 5.5–12 cm long, usually 2–4 mm wide. Lower bract 1.0–1.5 cm long, usually 0.7–1.0 mm wide. Inflorescence composed of 1–2 subsessile and (4–) 6–10 (rarely to 12) pedunculate clusters; peduncles often with secondary branches and 1–3 clusters on up to 1 cm long secondary peduncles; peduncles flexuose to arcuate, 0.2–0.3 mm in diam., 2.0–2.5 (–4.5) cm long, ±smooth to sparsely papillose. Clusters oblong-cylindrical, 0.5–0.8 cm long and up to 0.5 cm wide, 5–15-flowered. Bracteoles lanceolate-ovate, with outer ones long acuminate, 1.5–2.0 mm long, shorter than perianth, sparsely ciliate. Tepals equal, 2.3–2.8 (–3.0) mm long, narrowly lanceolate, acute to acuminate, pale castaneous brown to dark brown, usually with a narrow pale margin and often with a pale yellowish-stramineous middle part. Anthers usually 0.3–0.6 mm long; filaments usually 0.9–1.1 mm long; style c. 0.4 mm long; stigmas less than 1 mm long. Capsule ±globular, obtuse, not mucronate; capsule segments castaneous brown, usually (1.4–)1.5–1.8 mm long and 1.1–1.2 mm wide. Seeds 0.8–1.0 mm long, 0.6–0.8 mm wide. 2n=24, c.30, *fide* I.Hedberg & O.Hedberg, *Bot. Not.* 130: 11 (1977). Fig. 27.

leaves 2–3 (–4), usually 8–13 cm × 3.0–4.5 mm, hairy; leaf tip obtuse. Lower bract herbaceous, c. 6 cm × 1 mm, erecto-patent, exceeding inflorescence, with obtuse tip; upper bracts gradually membranous; middle and upper cluster bracts membranous with long acute tip. Inflorescence erect, usually congested and forming an elongated dense head 2–3 (–5) × 0.7–1.0 cm, very often ±interrupted in lower part and lobulate, composed of 6 to many dense clusters of 8–20 flowers, lower cluster sometimes remote or on a long peduncle at the axil of the upper caudine leaf; peduncle smooth. Bracteoles 2.5–3.0 mm long, white-membranous, long fimbriate-ciliate (whole inflorescence has a hairy appearance). Tepals subequal, lanceolate, (2.4–) 2.8–3.2 mm long, entire or with a few teeth near the apex, acute; outer tepal long acuminate, castaneous brown, whitish bordered or unbordered. Stamens 6; anthers c. 0.6–0.9 mm long, slightly shorter or longer than 0.6–0.7 mm long filaments. Style 0.4–0.6 mm long; stigmas 1.5–2.5 mm long. Capsule ±ovoid, obtuse or very slightly subacute, castaneous brown, shorter than tepals; capsule segments 1.9–2.1 × 1.2–1.4 mm. Seeds ±elliptoidal, castaneous brown, 0.9–1.1 mm long, 0.6–0.7 mm wide, with a broad whitish caruncle 0.10–0.15 mm long. 2n=24 [(Bie 66129, O.Hedberg 1216, herbarium label records; I.Hedberg & O.Hedberg, *Bot. Map: H.Weimarck, *Svensk Bot. Tidskr.* 40: 173, fig. 14 (1946).

Perennials, c. 20–50 cm tall, densely caespitose; rhizome short, vertical; stolons absent. Basal leaves up to 10–15 cm long, 2.5–5.0 mm wide, ciliate; caudine leaves 2–3; upper leaves 2.5–6.0 cm long, 2–3 mm wide; all leaves with obtuse swollen tip, margins papillose-serrulate. Lower bracts 1–2, usually 1.0–2.5 cm long, obtuse to subacute, usually ±overtopping inflorescence. Inflorescence congested in a dense many-flowered head c. 1–2 × 1.0–1.2 cm. Bracteoles 1.5–2.0 mm long, ±ovate, ciliate-fimbriate. Tepals subequal, glabrous, straw-brown to brown with darker middle stripe and pale border, lanceolate, acuminate, 2.8–3.5 mm long. Stamens 6; anthers 0.8–1.1 mm long; filaments 0.5–0.7 mm long; style 0.7–0.8 mm long; stigmas 2.0–2.4 mm long. Capsule pale brown, obovate, indistinctly apiculate-submucronate; capsule segments usually 2.2–2.4 × 1.6–1.7 mm. Seeds oblong-ovoid, pale brown, 0.7–0.9 (–1.0) mm long, 0.6–0.7 mm wide; appendage 0.2–0.3 mm long.

Endemic to South Africa. 27: CPP, LES, NAT, OFS, TVL. In moist grasslands in the mountains. Map 100.
